

**Dr. Babasaheb Ambedkar Marathwada University,  
Aurangabad – 431001 (MS)**

**Department of Physics**

(UGC-SAP and DST-FIST Funded)  
Department Establishment Year-1965

**Structure and Curriculum**

**For**

**M. Sc. (Physics) Programme**

**(Choice Based Credit System)**

**(Effective from June 2020 onwards)**

## **Structure and Curriculum for M. Sc (Physics) Programme (Choice Based Credit System)**

The M.Sc. (Physics) programme is divided into four semesters having 96 credits (94 + 02). There are 18 theory courses of 68 credits subdivided into 04 core courses of 16 credits, 06 foundation courses of 22 credits and 07 elective courses of 28 credits ( Generic Elective : 24 credits and Open Elective : 04 Credits). Besides there are 08 laboratory courses of 20 credits, Research project of 08 credits (distributed in three semesters; II<sup>nd</sup> semester 02 credits, III<sup>rd</sup> semester 03 credits and IV<sup>th</sup> semester 03 credits) and one course on constitution of India is of 02 credits. Tutorial, Assignments and Seminar presentation are integral components of all theory courses. Approximately 16 % are core courses, 20 % are foundation courses, 28 % are elective courses, 32 % are Laboratory courses and 8 % weightage is given for research project. Approximately 10 % weightage is given for research components (08 credits for research project at 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> semester, 02 credit for Research methodology foundation course at 1<sup>st</sup> semester). There are 18 options in 3<sup>rd</sup> semester and 16 options in 4<sup>th</sup> semester for generic elective courses. Students can opt any course of 04 credits (Open Elective) from any department from the University campus.

### **Eligibility:**

Those who have completed B. Sc. with Physics as an optional subject from any recognized University/ Institution are eligible for registration subject to the rules and regulations laid down by Dr. Babasaheb Ambedkar Marathwada University, Aurangabad time to time.

### **Admission / Promotion Process:**

In response to the advertisement for registration, interested students will have to register themselves. Admission will be done on the basis of Common Entrance Test (CET) OR as per the rules and regulations laid down by Dr. Babasaheb Ambedkar Marathwada University, Aurangabad time to time, and performance of students at their qualifying graduate level examination (May be B.Sc. Physics or may be B.Sc. Aggregate that will be as per the rules and regulations laid down by Dr. Babasaheb Ambedkar Marathwada University, Aurangabad). Once the student is admitted he / she will be promoted to the 2<sup>nd</sup> year (3<sup>rd</sup> semester) with full carryon that Depends on University rules given by time to time. Students will have to register themselves for every consecutive semester. Dropout students will be allowed to register for respective semester as and when the concerned courses are offered by the department, **HOWEVER HE / SHE SHOULD NOT EXCEED MORE THAN TWICE THE DURATION OF THE COURSE FROM THE DATE OF FIRST REGISTRATION AT PARENT DEPARTMENT.** The admission of the concern student will be automatically cancelled if he / she fail to complete the M. Sc. degree within a period of maximum four years / eight semesters.

### **Choice Based Credit System (CBCS):**

The choice based credit system has been adopted by this department. This provides flexibility to make the system more responsive to the changing needs of our students, the professionals and society. It gives greater freedom to students to determine their own pace of study. The credit based system also facilitates the transfer of credits.

- Students will have to earn 96 credits for the award of M.Sc. (Physics) degree.
- Out of 96 credits, students will have to earn 90 credits (Core courses worth 16 credits, foundation courses worth 22 credits, generic elective courses worth 24 credits, laboratory courses worth 20 credits and research project worth 08 credits) from Physics department, 04 credits of open elective from any other Department in the university campus and 02 credits from the course 'Constitution of India'.

**Credit-to- contact hour Mapping:**

One contact hour per week is assigned 1 credit for theory and 0.5 credits for laboratory courses/ research project. Thus a 4 - credit theory course corresponds to 4 contact hours per week and same analogy will be applicable for laboratory courses / research project.

**Course Structure:**

<b>Semester I ( Core and Foundation Courses )</b>				
<b>Course</b>	<b>Course Title</b>	<b>Teaching time/week</b>	<b>Marks</b>	<b>Credits</b>
PHYC-111	Mathematical Methods in Physics	4 hours	100	4
PHYC-112	Classical Mechanics	4 hours	100	4
PHYC-113	Quantum Mechanics	4 hours	100	4
PHYC-114	Statistical Mechanics	4 hours	100	4
PHYF-115	Research Methodology	2 hours	50	2
<b>IC-01</b>	<b><i>Constitution of India</i></b>	<b>2 hours</b>	<b>50</b>	<b>2</b>
PHYL- 121	Lab course 1 ( General Physics )	4 hours	50	2
PHYL- 122	Lab course 2 (Computational Physics based on PHYC -111, 112, 113 and 114)	4 hours	50	2
<b>Total Credits for Semester I : 24 ( Theory : 20 ; Laboratory : 04 )</b>				
<b>Semester II ( Foundation Courses)</b>				
PHYF-211	Foundation Course in Electronics (Linear and Digital Electronics)	4 hours	100	4
PHYF-212	Foundation Course in Spectroscopy (Atomic and Molecular Physics)	4 hours	100	4
PHYF-213	Foundation Course in Nuclear Physics ( General Nuclear Physics)	4 hours	100	4
PHYF-214	Foundation Course in Condensed Matter Physics (General Condensed Matter Physics)	4 hours	100	4
PHYL-221	Lab course 3 (Condensed Matter Physics + Nuclear Physics+ Spectroscopy)	4 hours	50	2
PHYL-222	Lab course 4 (Electronics + Computational Physics)	4 hours	50	2
PHYR-231	Research Project Part -I (Review of literature for Research Project and Formulation of Topic of Research Project)	4 hours	50	2
<b>Total Credits for Semester II : 22 ( Theory : 16 ; Laboratory : 04; Research project: 02 )</b>				

<b>Semester III ( Foundation and Generic Elective Courses )</b>				
PHYF-311	Electrodynamics	4 hours	100	4
PHYE-312	Generic Electives 1 ( A1/ B1/ C1/ D1)	4 hours	100	4
PHYE-313	Generic Electives 2 ( A2/ B2/ C2/ D2)	4 hours	100	4
PHYE-314	Generic Electives 3 ( A3/ B3/ C3/ D3/ E3 / F3 / G3 / H3 / I3/J3) <b>(Any one)</b>	4 hours	100	4
PHYL-321	Lab course 5 ( Based on Electives A1/ B1/ C1/ D1)	6 hours	50	3
PHYL-322	Lab course 6 ( Based on Electives A2/ B2/ C2/ D2)	6 hours	50	3
PHYR-331	Research Project Part II ( Experimental Work)	6 hours	50	3
<b>Total Credits for Semester III : 25 ( Theory : 16 ; Laboratory : 06 ; Research Project : 03)</b>				
<b>Semester IV ( Generic and Open Elective Courses )</b>				
PHYE-411	Generic Electives 4 ( A4/ B4/ C4/ D4)	4 hours	100	4
PHYE-412	Generic Electives 5 ( A5/ B5/ C5/ D5)	4 hours	100	4
PHYE-413	Generic Electives 6 ( A6/ B6/ C6/ D6/E6/F6/G6/H6 ) <b>(Any one)</b>	4 hours	100	4
OELE-101	Open Elective ( from other Departments) / SWAYAM course	4 hours	100	4
PHYL-421	Lab course 7 (Based on Electives A4/ B4/ C4/D4)	6 hours	50	3
PHYL-422	Lab course 8 (Based on Electives A5/ B5/ C5/ D5)	6 hours	50	3
PHYR-431	Research Project Part III ( Dissertation and Presentation)	6 hours	50	3
<b>Total Credits for Semester IV : 25 ( Theory : 16 ; Laboratory : 06 ; Research Project : 03)</b>				
<b>Total Credits : 96 ( Sem I : 24 + Sem II : 22 : Sem III : 25 + Sem IV : 25)</b>				

<b>List of Generic Elective Courses for Semester III</b>			
Sr. No.	Code	Name of Course	Semester
		A: Electronics ; B : Spectroscopy C : Nuclear Physics D : Condensed Matter Physics	
1	A1	8086 Microprocessor and Interfacing	III
2	B1	Atomic Spectroscopy	III
3	C1	Radioactivity and Nuclear Decay	III
4	D1	Crystallography	III
5	A2	Microwaves	III
6	B2	Molecular Spectroscopy	III
7	C2	Reactor Physics	III
8	D2	Electrical Properties of Solids and Superconductivity	III
		<b>PHYE – 314; Elective 3 (Any one)</b>	
9	A3	Industrial Electronics	III
10	B3	Modern Trends in Spectroscopy	III
11	C3	Nuclear Reactions and Nuclear Energy	III
12	D3	Physics of Nano materials	III
13	E3	X-Ray Diffraction	III
14	F3	Thin Film and Vacuum Technology	III
15	G3	Methods of Theoretical Physics	III
16	H3	Communication Electronics	III
17	I3	Nuclear Spectroscopy	
18	J3	Micro Electro Mechanical System ( MEMS)	
<b>List of Generic Elective Courses for Semester IV</b>			
1	A4	Advanced Sensor Technology	IV
2	B4	Applied Spectroscopy	IV
3	C4	Particle Physics, Nuclear forces and Cosmic rays	IV
4	D4	Magnetic Materials and Super fluidity	IV
5	A5	8051- Microcontroller	IV
6	B5	Lasers Nonlinear Optical mixing and Spectroscopic Phenomena	IV
7	C5	Radiation Measurements And Nuclear Dosimetry	IV
8	D5	Material Synthesis and Characterization	IV
		<b>PHYE-413; Elective 6 (Any one)</b>	
9	A6	Fundamentals of Sensors	IV
10	B6	The Physics of Dielectrics	IV
11	C6	Nuclear Fission, Fusion and Neutron Physics	IV
12	D6	Renewable Energy	IV
13	E6	Soil Physics	Iv
14	F6	Advance communication Electronics	IV
15	G6	Accelerator Physics	IV
16	H6	X-ray Spectroscopy	IV

**Notes:**

- Tutorial / assignments are integral components of all theory courses. Tutorials consist of conceptual as well as numerical problems / questions based the respective theory courses in the semester covering all four (04) units.
- Each course / paper should be taught for 60 contact hours (48 lectures and 12 tutorials).
- Teaching duration for LAB COURSES in first and second semesters should be of 04 hours and for those in third and fourth semesters should be 06 hours per week per batch.
- For LAB COURSES in First and Second semesters one batch of the students will be consisting 08 students and that of Third and Fourth semester 05 students (Specialization) for laboratory courses as well as project.
- Each of the theory courses is divided into four units.
- The content of theory course / paper as well laboratory (practical) course may be modified time to time ( with the approval DC) to keep pace with the recent developments and trends in the subject.

**Course Contents:**

Learning objectives and learning outcomes will be integral part of course contents. Learning objectives will describe why the course is necessary? Why it should be taught as Core / Foundation / Elective? Why it should be taught at Semester I / Semester II / Semester III / Semester IV and learning outcomes will describe how the course will be beneficial? What are the job / research opportunities for the takers of the course? is the said course a pre-requisite for certain other courses? can one start an entrepreneurship after the said course or will the course help for such activity.

Each course will have 04 units and will have 60 contact hours (48 lectures and 12 tutorials). Reference section consists of latest references of reputed authors and publishers by having all details of the books such as title, author(s), edition, publisher, year, ISBN or ISSN, etc. In case of e-reference, a web link is also included.

**Attendance:**

Students must have 75 % of attendance in each core, foundation, elective, laboratory and research project course for appearing examination/ scholarship otherwise he / she will be strictly not allowed for appearing the examination of each course. However, students having 65 % attendance with medical certificate may request Head of the Department for the condensation of attendance.

**Departmental Committee:**

The existing Departmental Committee (DC) will monitor the smooth functioning of M. Sc. programme.

### **Results Grievances / Redressal Committee**

In Choice Base Credit System (CBCS) there is no redressal of assessed papers. In CBCS – system, the assessed papers are shown to the students and it is the duty of the student to go through the assessed papers and solve the grievances if any at the respective teacher only. It is the moral duty of the student to write SEEN and SATISFIED on the assessed answers book shown by the teacher in-charge of that respective paper. Once the assessed papers are submitted to the office, then the papers will not be shown/given to the students and any type of grievances/complaints about the assessment will not be entertained.

Even if, there are some grievances, the student must give a written application to Head of the Department before declaration of the result about his/ her grievances. The Head of the Department will constitute a Grievances / redressal committee in the department to resolve all grievances relating to the evaluation. The committee shall consist of Head of the Department (Chairman), the concerned teacher of a particular course and senior faculty member of the Departmental Committee. The decision of Grievances / redressal committee will have to be approved by the Department committee. The decision of DC will be the final decision.

### **Evaluation Methods:**

- The assessment will be based on 20:80 ratio of continuous internal assessment (CIA) and semester end examination (SEE).
- Combined passing in CIA and SEE. In case of failure/absence in CIA of a particular course, student will have to appear for the same CIA in the same semester, with the permission of the Head of the Department.
- In case a student fails in certain courses in a particular semester and the same courses are modified / revised / removed from the curriculum in due course of time, the student will have to appear as per the newly framed curriculum and or pattern in subsequent semester at his / her responsibility.

### **Continuous Internal Assessment (CIA):**

- There will be 20 marks for Continuous Internal Assessment. Distribution of 20 marks will be as follows; there will be two internal tests of 20 marks each. The first internal test should be after completion of 40 to 50 % curricula and on the course completed (Unit I and II). Second internal test should be after completion of 100% curricula and on the 50 % remaining curricula (Unit III and IV). Continuous Internal Assessment will consist of 5 questions of 5 marks each and the first question will be the objective of 5 marks. There will be four questions of descriptive nature and the student has to solve three out of four. The average of the two internal tests will be considered as the CIA marks out of 20.

### **Semester End Examination (SEE):**

- The semester end theory examination for each theory course will be of 80 marks. The total marks shall be 100 for 4 credit theory course (80 marks semester end exam + 20 marks CIA).
- Pattern of semester end question paper will be as below:
  - The semester end examination of theory course will have two parts ( 20+80 = 100 Marks)
  - Part A will be consisting of 10 questions having 2 marks each (multiple choice questions) as compulsory questions and it should cover entire course curriculum (20 Marks) having at least 2 questions from each unit of course curriculum.
  - Part B will consists (06) questions (1.5 questions from each of 04 units and each question will be of 15 marks). The students will have to attempt any four questions out of six.
  - 20 to 30% weightage can be given to problems/ numerical wherein use of non-programmable scientific calculator may be allowed.
  - Number of sub questions (with allotment of marks) in a question may be decided by the examiner.
- Semester end examination (SEE) time table will be declared by the departmental committee (as per the University annual calendar). The paper setting and assessment of theory courses, laboratory courses and research project will be done by external and internal examiners. However, in case of non-availability of external examiner for either paper setting or assessment or both, department committee will be empowered to take appropriate decision.
- Assessment of laboratory courses and research project will be done by the external and internal examiners. Student must perform at least eight experiments from each laboratory course. The semester end practical examination will be conducted at the end of each semester.
- The Head of the Department shall send all results to the Controller of Examination for further processing.

### **Earning Credits:**

At the end of every semester, a letter grade will be awarded in each course for which a student had registered. A student's performance will be measured by the number of credits that he/she earned by the weighted Grade Point Average (GPA). The SGPA (Semester Grade Point Average) will be awarded after completion of respective semester and the CGPA (Cumulative Grade Point Average) will be awarded at the end of the 4<sup>th</sup> semester.

### **Grading System:**

- The grading reflects a student-own proficiency in the course. A ten point rating scale shall be used for the evaluation of the performance of the students to provide letter grade for each course and overall grade for the Master Programme. Grade points are based on the total number of marks obtained by him / her in all heads of the examination of the course. The grade points and their equivalent range of marks are shown in Table-I

**Table – I : Ten point grade and grade description**

Marks Obtained (%)	Grade Point	Letter Grade	Description
90-100	9.00- 10	O	Outstanding
80-89	8.00-8.90	A <sup>++</sup>	Exceptional
70-79	7.00-7.90	A <sup>+</sup>	Excellent
60-69	6.00-6.90	A	Very Good
55-59	5.50-5.90	B <sup>+</sup>	Good
50-54	5.00-5.40	B	Fair
45-49	4.50-4.90	C <sup>++</sup>	Average ( Above)
41-44	4.1-4.49	C	Average
40	4.0	P	Pass
< 40	0.0	F	Fail ( Unsatisfactory
	0.0	AB	Absent

- Non appearance in any examination / assessment shall be treated as the students have secured zero marks in that subject examination / assessment.
- Minimum P grade (4.00 grade points) shall be the limit to clear / pass the course / subject. A student with F grade will be considered as ‘failed” in the concerned course and he / she have to clear the course by appearing in the next successive semester examinations.
- Every student shall be awarded grade points out of maximum 10 points in each subject (based on 10 point scale). Based on the grade points obtained in each subject, Semester Grade Point Average (SGPA) and then Cumulative Grade Point Average (CGPA) shall be computed. Results will be announced at the end of each semester and CGPA will be given on the completion of M. Sc. programme.

### **Computation of SGPA (Semester Grade Point Average) and CGPA ( Cumulative Grade Point Average)**

Grade in each subject / course will be calculated based on the summation of marks obtained in internal and semester end examination.

The computation of SGPA and CGPA will be as below

- Semester Grade Point Average ( SGPA) is the weighted average points obtained by the students in a semester and will be computed as follows

$$\text{SGPA} = \frac{\text{Sum (Course Credit X Number of Grade Points in concern Course Gained by the Student)}}{\text{Sum (Course Credit)}}$$

The SGPA will be mentioned on the mark sheet at the end of every semester.

- The Cumulative Grade Point Average (CGPA) will be used to describe the overall performance of a student in all semester of the course and will be computed as under.

$$\text{CGPA} = \frac{\text{Sum (All four Semester SGPA)}}{\text{Total Number of Semester}}$$

The SGPA and CGPA shall be rounded off to the second place of decimal.

### **Grade Card**

Results will be declared by the Departmental Committee and the grade card (containing the grades obtained by the student along with SGPA) will be issued by the University after completion of every semester. The grade card will be consisting of following details.

- Title of the courses along with code opted by the student.
- Credits associated with the course.
- Grades and grade points secured by the student.
- Total credits earned by the student in a particular semester.
- Total credits earned by the students till that semester.
- SGPA of the student.
- CGPA of the student (at the end of the 4<sup>th</sup> semester).

### **Cumulative Grade Card**

The grade card sheet showing details grades secured by the student in each subject in all semester along with overall CGPA will be issued by the University at the end of 4<sup>th</sup> semester.

# Semester - I

## **M. Sc. (Physics) Curriculum**

### **Semester – I**

#### **PHYC-111: Mathematical Methods in Physics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

#### **Learning Objectives:**

1. To facilitate the students to understand -
  - a) The basic elements of complex mathematical analysis, including the integral transform and Laplace transform.
  - b) To expand a function in terms of a Fourier series, with knowledge of the conditions for the validity of the series expansion.
  - c) To apply integral transform (Fourier and Laplace) to solve mathematical problems of interest in physics, use Fourier transforms as an aid for analyzing experimental data.
  - d) To solve partial differential equations of second order by use of series expansion (Fourier series) and integral transforms.

#### **Learning Outcomes:**

1. After finishing the course the student should be able to:
  - a) master the basic elements of complex mathematical analysis, including the integral theorems, obtain the residues of a complex function and to use the residue theorem to evaluate definite integrals
  - b) Solve ordinary differential equations of second order that are common in the physical sciences.
  - c) Expand a function in terms of a Fourier series, with knowledge of the conditions for the validity of the series expansion.
  - d) Apply integral transform (Fourier and Laplace) to solve mathematical problems of interest in physics, use Fourier transforms as an aid for analyzing experimental data.
  - e) Solve partial differential equations of second order by use of standard methods like separation of variables, series expansion (Fourier series) and integral transforms.
  - f) Solve some simple classical variational problems.

#### **Course Contents:**

##### **Unit I: Fourier series (09 Contact Hours)**

Definition, Evaluation of coefficient, Fourier series representation of even and odd function  
General properties of Fourier series, simple applications, convergence, integration, differentiation, problems.

## **Unit II: Integrals Transforms (13 Contact Hours)**

Fourier Transforms: Fourier Integral theorem. Fourier Transform. Examples. Fourier transform of trigonometric, Gaussian, finite wave train & other functions. Representation of Dirac delta function as a Fourier Integral. Fourier transform of derivatives, Inverse Fourier transform, Convolution theorem. Properties of Fourier transforms (translation, change of scale, complex conjugation, etc.). Three dimensional Fourier transforms with examples. Application of Fourier Transforms to differential equations: One dimensional Wave and Diffusion/Heat Flow Equations.

## **Unit III: Laplace Transforms (13 Contact Hours)**

Laplace Transform (LT) of Elementary functions. Properties of LTs: Change of Scale Theorem, Shifting Theorem. LTs of Derivatives and Integrals of Functions, Derivatives and Integrals of LTs. LT of Unit Step function, Dirac Delta function, Periodic Functions. Convolution Theorem. Inverse LT. Application of Laplace Transforms to Differential Equations: Damped Harmonic Oscillator, Simple Electrical Circuits.

## **Unit IV: Complex Analysis (13 Contact Hours)**

Brief Revision of Complex Numbers and their Graphical Representation. Euler's formula, De Moivre's theorem, Roots of Complex Numbers. Functions of Complex Variables. Analyticity and Cauchy-Riemann Conditions. Examples of analytic functions. Singular functions: poles and branch points, order of singularity, branch cuts. Integration of a function of a complex variable. Cauchy's Inequality. Cauchy's Integral formula. Simply and multiply connected region. Laurent and Taylor's expansion. Residues and Residue Theorem. Application in solving Definite Integrals.

## **Unit V: Tutorials, assignments and seminar presentations based on unit I, II, III and IV (12 Contact Hours)**

### **PHYC-112: Classical Mechanics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Course Objectives:** The themes dealt with in this paper:

- Classical Mechanics is a course where it all started
- Newton demonstrated that the same forces and laws of mechanics that apply to apples and everyday objects (the terrestrial) also govern the behavior of the moon and the planets (the celestial).
- In a wide array of physical situations, classical mechanics is all you need to be able to predict the motion of apples, baseballs, bones, bridges, cars, cats, and so on.
- The universality of the laws and their wide range of applicability, classical mechanics is an essential course for students of physics.

**Course Outcomes (COs):** The present unit attempts to achieve the following learning outcomes:

**At the end of the course the student should be able to;**

- |             |   |
|-------------|---|
| <b>CO-1</b> | Classical mechanics is a hot area of active research once more.   |
| <b>CO-2</b> | Chaos has lead to significant advances in mathematics and physics (for example, it offers some explanation for the phenomenon of ergodicity in statistical mechanics) and fundamentally changes the way we look a predictability and solvability of dynamical systems |
| <b>CO-3</b> | While classical mechanics, by definition, does not include the 21 <sup>st</sup> century advances of quantum mechanics and relativity, it is nevertheless an essential prerequisite for study of these topics.   |
| <b>CO-4</b> | We use concepts of forces and energy throughout physics, so a strong grounding in classical mechanics is essential.   |
| <b>CO-5</b> | Students will study the phenomenon of chaos, fully solve two-body orbit problems and derive Kepler's Laws, and develop the theory of effective forces that arise in no inertial frames.   |

## Learning Objectives:

- Classical mechanics is a course where it all started. Newton demonstrated that the same forces and laws of mechanics that apply to apples and everyday objects (the terrestrial) also govern the behavior of the moon and the planets (the celestial).
- He showed that nature had a high degree of structure and order, and that we could hope to uncover it and so physics was born.
- Newton's laws of motion, or mechanics, were not only universal, they proved to be useful. In a wide array of physical situations, classical mechanics is all you need to be able to predict the motion of apples, baseballs, bones, bridges, cars, cats, and so on. For these two reasons alone: the universality of the laws and their wide range of applicability, classical mechanics is an essential course for students of physics.
- There's more: recent developments in classical mechanics have led to the theory of Chaos.

## Learning Outcomes:

- Classical mechanics is a hot area of active research once more.
- Chaos has led to significant advances in mathematics and physics (for example, it offers some explanation for the phenomenon of ergodicity in statistical mechanics) and fundamentally changes the way we look at predictability and solvability of dynamical systems.
- And there's even more: while classical mechanics, by definition, does not include the 21<sup>st</sup> century advances of quantum mechanics and relativity, it is nevertheless an essential prerequisite for study of these topics. For example, the Hamiltonian in quantum mechanics originates from the classical mechanics Hamiltonian that we will encounter.
- We use concepts of forces and energy throughout physics, so a strong grounding in classical mechanics is essential. While students studied classical mechanics already in B.Sc, in this course we will encounter more advanced techniques and solve a wider variety of problems. For example, we will encounter a reformulation of classical mechanics by Lagrange (and Hamilton) which makes it easier to deal with complicated situations such as more general coordinates or constraints on the motion. We will study the phenomenon of chaos, fully solve two-body orbit problems and derive Kepler's Laws, and develop the theory of effective forces that arise in non-inertial frames.
- We will close with the profound Liouville's theorem for Hamiltonian mechanics and its implications in chaotic and planetary systems.

## Course Contents:

### Unit I : Constrained Motion

Constraints, Classification of Constraints, Principle of Virtual Work, D'Alembert's principle and its applications (Problems only), (One or Two Problems should be discussed with D'Alembert's, Lagrangian, Hamiltons from same set of problems). **Lagrangian formulation:** Generalized coordinates, Lagrange's equations of motion, properties of kinetic energy function, theorem on total energy, generalized momenta, cyclic-coordinates, integrals of motion, Jacobi integrals and energy conservation.

## Unit II: Hamilton's formulation

Hamilton's function and Hamilton's equation of motion, configuration space, phase space and state space, Lagrangian and Hamiltonian of relativistic particles and light rays. **Variational Principle:** Variational principle, Euler's equation, applications of variational principle, shortest distance problem, brachistochrone, Geodesics of a Sphere

## Unit III: Canonical transformation and central force

Generating function, Conditions for canonical transformation and problem, theory of chaos, Two body central force problem, stability of orbits, condition for closure, integrable power laws, Kepler's problems, orbits of artificial satellites, Virial theorem. **Poisson Brackets:** Definition, Identities, Poisson theorem, Jacobi-Poisson theorem, Jacobi identity, (Statement only), invariance of PB under canonical transformation.

## Unit IV: Rotational and oscillatory motion

Rotating frames of reference, inertial forces in rotating frames, Larmour precession, electromagnetic analogy of inertial forces, effects of Coriolis force, Foucault's pendulum, small oscillations, Normal co-ordinates and applications to vibrations of linear in triatomic molecules. Liouville's theorem for Hamiltonian mechanics and its implications in chaotic and planetary systems.

**PHYC-113: Quantum Mechanics**  
**(Credits: 04; Contact Hours: 60)**  
**Lectures: 48 Tutorials: 12**

**Learning Objectives:**

- To answer fundamental questions in physics
- To further the ability to design and exploit physical phenomena for applications.

**Learning Outcomes of the Course:**

- Ability to learn important quantum mechanical concepts such as electronic levels in the hydrogen atoms or the rate at which electrons scatter from a defect
- Applications to typical problems encountered in technology-related applications
- Solving problems concerning real applications, number / concept oriented problems in nuclear physics, spectroscopy, condensed matter physics, semiconductor physics, etc.

**Course Contents:**

**Unit I – Quantum Mechanics in 1-D: Exact Solution of Schrodinger Equation in 1-D - The Free Particle:** Continuous States; **The Potential Step:** Cases  $E > V_0$  and  $E < V_0$  [tunneling]; Tunneling effect; **The Potential Barrier and Well Cases**  $E > V_0$  and  $E < V_0$  [tunneling]; **The Harmonic Oscillator** : Solution with ladder operator method [Zettili pp 239-248]

**Unit II – Quantum Mechanics in 3-D : Angular Momentum : Physical Symmetries and Conservation Laws:** Introduction Rotation Symmetry and Angular Momentum (Qualitative description) Orbital Angular Momentum  $L$  Commutator algebra of  $L$  and  $p$ ,  $L$  and  $r$ ,  $L^2$  and  $r^2$ ; Eigen values and Eigenfunctions; Spin Angular Momentum: Stern Gerlach experiment General angular momentum: definition of  $J$ , commutator of  $J$  and components of  $J$ , ladder operators  $J_+$  and  $J_-$ , commutators of ladder operators, ladder operator with  $J$  and  $J_z$ , eigen values of  $J_+$ ,  $J_-$ ,  $J^2$ , components of  $J$ ;

**Unit III- Approximation methods:** (a) The WKB approximation. Application to bound states connecting formulae Bohr Sommerfield Quantization rules, WKB application to transmission problem, (b) Variational method: Particle in a box, harmonic oscillator,  $H_2^+$  ion; (c) Time independent Perturbation theory, non-degenerate and degenerate cases; (d) Time dependent perturbation theory, Fermi's rule, Harmonic perturbation

**Unit IV- Scattering Theory:** Introduction , Scattering Amplitude and Differential and Total Cross Sections, Method for determination of differential scattering cross section: (a) Partial Wave Analysis (no detailed derivation expected; only problems based on end formula are to be taught); (b) The Born Approximation: The First Born Approximation (derivation from Liboff p 623 and problems), Validity of the First Born Approximation

**PHYC-114: Statistical Mechanics****(Credits: 04; Contact Hours: 60)****Lectures: 48; Tutorials: 12****Learning Objectives:**

- To explain various properties of matter in both equilibrium with environment and in non-equilibrium
- To understand behaviour of collection of quantum particles

**Learning Outcomes:**

- Applications to various modern discoveries such as Ohm's law, quantum Hall effect, Bose Einstein condensates
- In depth knowledge of the fundamental idea behind various phenomena in condensed matter physics
- Solution of numerical problems to help in various exams like JEST, GATE, etc.

**Course Contents:**

**Unit I : Ideal Fermi-Dirac Gas:** Fermi-Dirac distribution, Degeneracy, Electrons in metals, Thermionic emission, Magnetic susceptibility of free electrons (Pauli paramagnetism)

**Unit II : Ideal Bose systems:** Photons, Phonons in solids, Bose-Einstein Condensation Liquid He, Tisza 2-fluid model, Landau theory, superfluidity, Superconductivity

**Unit III: Semiconductor Statistics:** Statistical equilibrium of free electrons in semiconductors, Non-degenerate case, Impurity semiconductors, Degenerate Semiconductors, Occupation of donor levels, Electrostatic property of P-N junction

**Unit IV: Special Topics in Statistical Mechanics: Non-Equilibrium States:** Boltzmann transport equation, Particle diffusion, Electrical conductivity, Isothermal Hall effect, Quantum Hall effect; The 1-D Ising model

### **PHYF-115: Research Methodology**

**(Credits: 02; Contact Hours: 30)**

#### **Learning Objectives:**

1. to define research and describe the research process and research methods
2. to understand qualitative research and methods used to execute and validate qualitative research
3. to know how to apply the basic aspects of the research process in order to plan and execute a research project.
4. to provide insight into the processes that lead to the publishing of research.
5. to be able to present, review and publish scientific articles

#### **Learning Outcomes:**

1. Students will be able to -
  - a) understand and explain research process
  - b) do systematic literature survey, formulation of a research topic, study design, analysis and interpretation of data.
  - c) to design a research approach for a specific research issue of their choice.
  - d) select a suitable analytical method for a specific research approach.
  - e) demonstrate a good understanding of how to write a research report.
  - f) critically assess published quantitative research with regard to the statistical methods and approaches adopted
  - g) create a research document for implementation research project

#### **Course Contents:**

##### **Unit I : Research Fundamentals:**

Introduction: Definition, objectives of the research, characteristics of the research, what makes people to do research, importance of research,

##### **Unit II : Identification of Research Problem :**

Defining the research problem: Identification of research problems, selection of research problem, facts one should know regarding selection of research problem, the process of research problem definition, some facts involved in defining research problem, Case Studies.

### **Unit III : Formulation of Research Problem :**

Formulation of the problems: steps involved in defining a problem, formulation of the problems, Formulation of hypothesis: Concept of hypothesis, hypothesis testing, Developing the research plan: implementation, interpreting and reporting the findings, Importance of hypothesis in decision making, Case Studies.

### **Unit IV: Research Report and Proposal Writing:**

Introduction, research proposal writing: costing, the research proposal, rationale for the study, research objectives, research methodology, target respondents, research Centres, sample size and sample composition, sampling procedures, research project execution, research units; An insight into research report and proposal, research project synopsis, research report writing : types of research reports, guidelines for writing reports; Steps in writing report, report presentation, typing the report, documentation and bibliography, formatting guidelines for writing a good research report / research paper, Case Studies.

#### **IC-01: Constitution India ((Credits: 02; Contact Hours: 30)**

This course will be taught at common level. University will arrange teaching classes for this course.

## PHYL-121: Lab course 1 (General Physics) Credits 02

### Learning Objectives:

- To have hands on training on measurements of fundamental constants in physics as well as computational physics.
- To gain knowledge about usage of units and dimensions, concepts in quantum mechanics, statistical mechanics and electrodynamics.
- To understand computational methods and their applications to quantum mechanic
- To understand how to solve Schrodinger equation,

### Learning Outcomes:

- To help a student in designing an experiment for measurements of desirables
- To gain knowledge in understanding various concepts in physics.

### (General Physics) Course content:

- (1) Determination of specific charge ( $e/m$ ) of an electron by Thomson method
- (2) Study of black body radiation and determination of the Planck constant  $h$
- (3) Verification of Bohr's theory using Franck Hertz apparatus
- (4) Study of Boltzmann statistics and determination of Boltzmann constant  $k_B$
- (5) Determination of thickness of a given thin wire using LASER
- (6) Determination of wavelength of a given source using Michelson's interferometer
- (7) Determination of compressibility of a given liquid using Raman Nath experiment
- (8) Determination of spin on an electron using Stern Gerlach experiment
- (9) Study of the x-ray telexometer
- (10) Determination of thermionic work function of filament material
- (11) Determination of charge on an electron by Millikan's oil drop method

**A student is expected to perform at least 8 experiments in each of the courses.**

## PHYL-122

### Lab Course 2 (Computational Physics based on PHYC -111, 112, 113 and 114)

**Credits 02** (This course is based on computation using MS-EXCEL)

#### **Course content:**

- (1) Determine the roots of given equation/expression
- (2) Evaluation of given integrals using Simpson's 1/3 rule
- (3) Solution of Schrodinger equation for square / harmonic oscillator potential
- (4) Solution of Schrodinger equation for triangular potential
- (5) Plotting the hydrogen atom ground state 1s and 2s wave functions
- (6) Determination of normalization constant for 1s wave function of hydrogen atom
- (7) Plotting the hydrogen atom ground state 2p wave function
- (8) Study of Gaussian Type Orbitals (GTOs) and Slater Type Orbitals (STOs)
- (9) Comparison of Gaussian Type Orbitals (GTOs) with Slater Type Orbitals (STOs)

**A student is expected to perform at least 8 experiments in each of the courses.**

# Semester - II

**PHYF-211: Foundation Course in Electronics**

**(Linear and Digital Electronics)**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Course Objectives:**

- 1           ▪ To establish the general method for analyzing and predicting the performance of operational amplifiers and related circuits.
- 2           ▪ To develop the students for designing realistic circuits to perform specified operations.
- 3           ▪ To enable the students to select available devices for intended operations.

**Course Outcomes (COs)**

At the end of the course, students will be able to:

- CO-1**    Discuss the general properties of an operational amplifier.
- CO-2**    Define the terms, input impedance, output impedance, bandwidth, input offset voltage, input offset current, CMRR, open loop voltage and slew rate.
- CO-3**    Design an inverting and non-inverting amplifier circuit or its special cases to meet the requirement.
- CO-4**    Analyze or design op-amp for the intended operations:  
Astable Multivibrator, Monostable Multivibrator, Wien bridge Oscillator and some related circuits.
- CO-5**    Explain gates, its related circuits, truth table and its realization.
- CO-6**    Analyze or designing of combinational and sequential circuits.

## **Course content:**

### **Unit I: Operational amplifier: ( 12 Contact Hours)**

Symbol and terminals, the ideal op-amp, the practical op-amp. Operational amplifier parameters: Input offset voltage, Input offset current, Input bias current, Input impedance, Output impedance, Open loop voltage gain, Common – Mode rejection ratio, Slew rate. Inverting, non - inverting amplifier.

### **Unit II: Applications of Operational Amplifier and Timing Circuits: (12 Contact Hours)**

Adder, Subtractor, Integrator, differentiator, Comparator & Schmitt's trigger; Wave form generators: Astable Multivibrator, Monostable Multivibrator, and Wien Bridge Oscillator. Integrated circuit timer: Block diagram of IC – 555, Monostable, Astable Multivibrator using IC-555.

### **Unit III: Numbers systems, Codes and Combinational Logic: (12 Contact Hours)**

Decimal, Binary, & Hexadecimal numbers systems, and its arithmetic's. BCD code. AND, OR, NOT operations, NAND and NOR operations, NAND and NOR as building blocks, Exclusive – OR operation. Boolean algebra, Standard Representation for Logical Functions, Half & Full adder, Parallel 4-bit adder, encoder (decimal to binary), Decoder (Decimal to BCD), BCD to seven segment decoder, Multiplexer: (4:1) and (8:1), Demultiplexer: (1:8) and (1:16) and their applications.

### **Unit IV: Sequential Logic: (12 Contact Hours)**

Flip-Flops: S-R, D- type, T-type, J-K and J-K master-slave. Shift registers: Serial in Serial out, Serial in parallel out, Parallel in Parallel out, Parallel in Serial out. Ripple counters: Mod-16, Mod – 12 and Mod- 10. Synchronous counters: Mod-8 and Mod-16.

**Unit V:** Tutorials, assignments and seminar presentations based on unit I, II, III and IV  
**(12 Contact Hours)**

**PHYF-212: Foundation Course in Spectroscopy**

**(Atomic and Molecular Physics)**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials:12**

**Course Objectives:** The themes dealt with in this paper:

- 1 ➤ The atom, the nucleus, the electron and the photon - four necessary steps for the development of quantum physics
- 2 ➤ The structure of the atom. Atoms in electric and magnetic fields. Fine and hyperfine structure. X-ray spectroscopy. Molecular structure
- 3 ➤ Rotation-, vibration- and electronic spectra. Chemical bonds. Optical spectroscopy.
- 4 ➤ Applying laser spectroscopic methods as well as other modern tools in atomic and molecular physics, special efforts will be made in laboratory work.

**Course Outcomes (COs):** The present unit attempts to achieve the following learning outcomes:  
**At the end of the course the student should be able to;**

- CO-1** The course is a continuation of the Atomic and Molecular Physics course.
- CO-2** Introductory Atomic- and Molecular Physics will be discussed more in detail.
- CO-3** A big part of the course will give a view of the modern experimental tools of Atomic- and Molecular Physics job prospects.

**Learning objectives:**

- The atom, the nucleus, the electron and the photon - four necessary steps for the development of quantum physics.
- The structure of the atom. Atoms in electric and magnetic fields. Fine and hyperfine structure. X-ray spectroscopy. Molecular structure. Rotation-, vibration- and electronic spectra.
- Chemical bonds. Optical spectroscopy. Applying laser spectroscopic methods as well as other modern tools in atomic and molecular physics, special efforts will be made in laboratory work.

## **Learning Outcome:**

- The course is a continuation of the Atomic and Molecular Physics course.
- Introductory Atomic- and Molecular Physics will be discussed more in detail.
- A big part of the course will give a view of the modern experimental tools of Atomic- and Molecular Physics job prospects.

## **Course Contents:**

### **Unit I: Introduction**

Stern Gerlach experiment, Quantum states of an electron. Quantum numbers. Spectra of Hydrogen atom. Spin angular momentum, orbital angular momentum. Coupling of spin and orbit. Fine structure, spectroscopic terms, selection rules. Spectra of the alkali elements. Interaction energy in L-S and j-j coupling, Hund's rule and term reversal. Zeeman effect in one valence electron atoms, interaction energy, selection rules, Zeeman patterns. Paschen-Back effect, Pauli principle. Hyper fine structure (Qualitative)

### **Unit II: Rotational spectroscopy:**

Classification of molecules, Interaction of radiation with rotating molecule, IR spectra of diatomic molecules, Rigid rotator, energy levels, eigen functions and spectrum of rigid rotator, non-rigid rotator, isotopic substitution, effect of vibration on rotation, Intensities of rotational lines, information derived from rotational spectra..

### **Unit III: Vibrational spectroscopy:**

Vibrational course structure, Deslandres table, Diatomic molecule as a harmonic oscillator, energy levels, eigen functions and spectrum of harmonic oscillator, Morse potential, anharmonic oscillator, vibrating rotator with & without Born Oppenheimer approximation.

### **Unit IV: Laser Fundamentals:**

Masers and lasers, methods of obtaining population inversion, Ammonia maser, Spontaneous and induced emission, Einstein's A and B coefficients, Properties of lasers, Principle & working of He-Ne, Ruby, semiconductor and color center.

### **PHYF-213: Foundation Course in Nuclear Physics**

**(General Nuclear Physics)**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objective:** The themes dealt with in this paper:

- This course will introduce students to the fundamentals of General Nuclear Physics.
- It aims to provide a coherent and concise coverage of traditional nuclear physics.
- Important topics of current research interest will be also discussed, such as radioactivity, radiation detector and accelerators which plays an important role in the realization of this course.
- A General Nuclear Physics is a foundation course as it is a preparatory course for university-level art and design education.

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- On successful completion of the course, students should be able to illustrate general considerations of Nuclear physics to atomic and nuclear system; make general orders of magnitude of estimation of physical effects.
- Explain how interaction of gamma radiation with matter; the working principle of accelerators and radiation detector.

**Pre-requisite** - This general nuclear physics is a pre-requisite for certain other courses.

- One can starts an entrepreneurship after the completion of this general nuclear physics foundation course.

#### **Course Contents:**

##### **Unit I : General Properties of Nucleus:**

Nuclear size and its determination, nuclear radii by electron scattering and mirror nuclei methods. Binding energy, mass defect, Packing fraction. Semi-empirical mass formula and its applications. Quantum numbers of nuclei, nuclear angular momentum, nuclear magnetic dipole moment, electric quadrupole moment.

**Unit II : Radioactivity (Natural and Artificial):**

The basis of the theory of radioactive disintegration, the disintegration constant, half life and the mean life. Successive radioactive transformation, radioactive equilibrium, the natural radioactive series, units of radioactivity. The discovery of artificial radioactivity, the artificial radio nucleids, electron and positron emission, orbital electron capture, the artificial radio nucleids: alpha emitters.

**Unit III : Nuclear Radiation detectors:**

Types of detectors, ionization chamber, G.M. Counters, proportional counter, semiconductor detector, counting errors, counting efficiency, scintillation counter, energy decapitation in phosphor, photoemission from phosphor.

**Unit IV : Nuclear Models and Acceleration of Charged particles:**

Liquid drop model, single particle levels and magic numbers, evidence of shell effects, Bhor-wheeler theory of fission. Shell model, single particle shell model, deformed nuclei and collective model, nuclear wave function for even-even nuclei, energy spectrum and wave function for odd – A nuclei. Acceleration of Charged particles: Cascade generators, Cockroft and Walton voltage multiplier, Vande Graff machine, tandem accelerators, linear multipole accelerator, wave-guide accelerator, cyclotron.

**Books:**

## **PHYE-214: Foundation Course in Condensed Matter Physics**

### **(General Condensed Matter Physics)**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:** This course deals with crystalline solids and is projected to make available students with the basic physical concept and mathematical tools used to portray solids. The course deals with groups of materials, as in the periodic table, in terms of their structure, electronic, optical, and thermal properties. Specific objectives are: To show how crystal symmetry leads to substantial mathematical simplifications when dealing with solids. To describe basic experimental measurements, to show typical data sets and to compare these with theory.

**Learning Outcomes:** The field of General Condensed Matter Physics investigates different classes of materials -metals, ceramics, electronic materials with an emphasis on the relationships between the underlying structure and the processing, properties, and performance of the materials. Research opportunities are offered as scientists and technologists, etc in national and international institutions.

### **Course Contents:**

#### **Unit I : Crystal Structure: (13 Contact hours)**

Lattice translation vectors and lattices, basis and crystal structure, primitive, non-primitive Wigner- Seiz cells, fundamental types of lattices, 2d & 3d Bravais lattices, characteristics of cubic lattices, miller indices, symmetry elements, point group and space groups, different crystal structures: hexagonal close packed structure, s.c., b.c.c., f.c.c, sodium chloride, diamond, Experimental method on the basis of Ewald Construction, Electron and Neutron diffraction by crystals, Atomic and geometric structure factors, Reciprocal lattice and Brillouin Zone.

#### **Unit II : Lattice Dynamic and Specific Heat: (13 Contact hours)**

Vibrations of one-dimensional monoatomic lattices: First Brillouin zone, Group velocity, long wavelength and force constant, Diatomic lattices, quantization of lattice vibrations, phonons, inelastic scattering of neutron by phonons, models of Einstein, Debye of lattice heat capacity, comparison with electronic heat capacity, anharmonicity, thermal expansion and thermal conductivity: thermal resistivity, Umklapp processes and problems: zero point lattice, Grunsissen constant, density of modes of square lattice.

#### **Unit III: Free electron model of metals: (11 Contact hours)**

Free electron gas in three dimensions, Fermi – Dirac distribution, heat capacity of electron gas, hall effect, Matthiessen rule, fermi surface, de Hass von Alfen effect, magnetoresistance, tight binding method, pseudopotentials.

## Unit IV: Energy bands in solids: (11 Contact hours)

Origin of energy band gap, Bloch function, Kronig-Penny Model, number of states in a band, distinction between metals, insulators and semiconductors, concept of holes, equation of motion for electron and holes, effective mass of electron and holes.

**PHYL-221 Lab course 3 (Condensed Matter Physics + Nuclear Physics + Spectroscopy) Credits: 02**

This course is based on **Foundation Courses: Condensed Matter Physics, Nuclear Physics and Spectroscopy**)

**Learning Objectives:** The themes dealt with in this paper:

- This course gives basic foundation to specialization in nuclear physics Condensed Matter Physics and Spectroscopy and applications.
- The course is an advanced course and requires special efforts. So, it can be taught in Semester II.
- The course will help the student to explain characteristics of Geiger Muller counter/tube: Operating voltage, Dead time and counting statistics.
- The course is most suitable in II<sup>nd</sup> semester, because this interpret the contents of the next following course PHYL-321-Lab course 5 (C1) Nuclear Physics to be covered as lab course in III<sup>rd</sup> semester.

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- After completing this course the student will be prepare to explain the scope and possibilities of studies in nuclear physics for research career as well as in industry.
- The students able to explain the characteristics of Geiger Muller counter/tube: Operating voltage, Dead time and counting statistics.
- This course is prerequisite to the second lab course as mentioned above for III<sup>rd</sup> semester.

**Course Contents:**

1. Study of given XRD data for cubic and diamond type materials and determination of lattice parameters.
2. Study of given XRD data for hexagonal type materials and determination of lattice parameters.
3. Determination of characteristics of Geiger Muller counter/tube: Operating voltage and Dead time.
4. Determination of characteristics of Geiger Muller counter/tube: Counting Statistics.
5. Study of variation of resistivity of given specimen using 4-probe method and determination of its energy band gap.

6. Determination of magnetic Susceptibility of diamagnetic/paramagnetic samples using Guoy type balance method and determination of number of unpaired electron.
7. Study of variation of dielectric constant as a function of temperature and verification of the Curie law and determination of the Curie temperature.
8. Determination of magnetogyric ratio of  $^1\text{H}$  in glycerin sample
9. Continuous wave NMR experiment in rubber and glycerine
10. Continuous wave ESR experiment in TCNQ and DPPH
11. Determination of band structure of given specimen.
12. Study of Hall Effect and determination of type and number of charge carriers, Hall coefficient and drift mobility
13. Study of UV Vis Spectra of II-VI type semiconductors

**A student is expected to perform at least 8 experiments.**

**PHYL-222; Lab course 4 (Electronics + Computational Physics) Credits: 02**

This course is based on **Foundation Course: Electronics**. It also contains some experiments based on **Computational Physics**. Students will choose any four experiments from list of experiments below based on Electronics and four experiments from list of experiments below based on computational physics)

**Course Contents:**

1. Determination of Characteristics of Op –Amp 741: CMRR and Slew rate.
2. Determination of Characteristics of Op –Amp 741: input offset voltage and input bias current.
3. Study of Inverting and non-inverting amplifier using Op-amp 741.
4. Study of Astable multivibrator using Op-amp 741.
5. Op- amp as comparator and Schmitt Trigger using op-amp 741.
6. Study of Wien bridge oscillator using op-amp 741.
7. Study of Monostable multivibrator using IC-555.
8. Study of Decimal to BCD encoder.
9. Study of diode matrix ROM.
10. Study of Mod 16 ripple counter
11. Study of Mod 10 and Mod 12 ripple counter.

**A student is expected to perform at least 8 experiments.**

**PHYR-231: Research Project Part I (Review of literature for Research Project and formulation of Topic of Research Project) : Credits 02**

Students are expected to formulate the topic of research project

# **Semester - III**

**PHYF-311: Foundation course in Physics**

**Electrodynamics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Outcomes:** Students will have achieved the ability to:

1. Use Maxwell equations in analyzing the electromagnetic field due to time varying charge and current distribution.
2. Describe the nature of electromagnetic wave and its propagation through different media and interfaces.
3. Explain charged particle dynamics and radiation from localized time varying electromagnetic sources.

**Learning Objectives:**

To apprise the students regarding the concepts of electrodynamics and Maxwell equations and use them various situations.

**Course content:**

**Unit I: Electromagnetic wave equation and field vectors:** Plane waves in free space. Dispersion of electromagnetic waves. Poynting vector in free space. Polarization of electromagnetic waves, electric field vector in terms of scalar and vector potential. Wave equation in terms of scalar and vector potential. Retarded potentials, Lienard Wiechert potential.

**Unit II: Reflection and Transmission of electromagnetic waves:** Laws of reflection and refraction, Fresnel's reflection and refraction for vertically and horizontally polarized waves. Brewster or polarizing angle, total internal reflection, reflection and transmission from good conductors for both polarization.

**Unit III: Guided waves, wave guide and cavities:** Electromagnetic wave propagation between two parallel conducting planes, (TE and TM waves). Rectangular waveguide, Characterizations wave impedance of rectangular waveguide cavity resonator (rectangular and cylindrical).

**Unit IV: Relativity and Formulation of Electrodynamics:** The relativity of magnetic and electric fields. Transformation of E and B fields. Invariance of Maxwell's equations. Four vectors, Maxwell's equation in four vector form.

**PHYE-312 Generic Electives 1 (A1/ B1/ C1/ D1)**

**PHYE-312 – Elective 1 (A1): 8086 Microprocessor and Interfacing**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

1. To facilitate the students to understand
  - a) the concepts of microprocessor and assembly language programming.
  - b) the concept of interfacing devices at laboratory as well industrial level
2. To provide an opportunity to the students to enter into entrepreneurship.

**Learning Outcome:**

1. Students will be able to learn
  - a) Microprocessor architecture, physical configuration of memory, logical configuration of memory, microprocessor programming and interfacing.
2. Students will be capable to perform following job
  - a) Industrial automation using 8086 interfacing and programming.
  - b) Start his / her own small scale industry for manufacturing microprocessor based automated devices.
3. Students will have option to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline.

**Course Contents:**

**Unit I: Introduction:**

Overview of Microcomputer structure and operation, memory, input / output, CPU, address bus, data bus, control bus, 8086 microprocessor family overview, **8086 internal architecture:** execution unit, (flag register, general purpose register, ALU), Bus interface unit, segment register, stack pointer register, pointer and index register [Refer Douglas and Hall book for above articles], **Pin out and pin functions of 8086 :** The pin out, power supply requirements, DC characteristics, input characteristics, output characteristics, pin connections ( common pins, maximum mode pins and minimum mode pins ) **Addressing Modes:** Data addressing modes: Register addressing, Immediate addressing, Direct addressing, register indirect addressing, base plus index addressing, register relative addressing, base relative plus index addressing, Programme

memory addressing modes: Direct program memory addressing, relative program memory addressing, indirect program memory addressing; stack memory addressing modes.

### **Unit II: Data Movement, Arithmetic and Logical Instructions:**

**MOV revised:** machine language, the opcode, MOD field, register assignments, R/M memory addressing, special addressing, **PUSH/POP** : PUSH, POP, initializing the stack; **Miscellaneous data transfer instructions:** XCHG, IN and OUT, **Arithmetic and Logic Instructions: Addition, subtraction and comparison: Addition:** Register addition, immediate addition, memory to register addition, array addition, increment addition, addition with carry; **Subtraction:** Register subtraction, immediate subtraction, decrement subtraction, subtraction with borrow; **Comparison, Multiplication and division: Multiplication:** 8 bit multiplication, 16 bit multiplication; **Division:** 8 bit division, 16 bit division; **Basic Logic Instructions:** AND, OR, Ex-OR, TEST, NOT, NEG; **Shift and Rotate: Shift:** left shift, right shift; **Rotate:** Rotate left, rotate right

### **Unit III: Program Control Instructions and Assembly Language Programming:**

**The Jump Group: Unconditional jump:** short jump, near jump, far jump, indirect jumps using an index; **Conditional Jumps:** LOOP, conditional LOOPS; **Procedures:** CALL, near CALL, far CALL, indirect memory address, RET; **Machine Control and Miscellaneous Instructions:** Controlling the carry flag bit, wait, HLT, NOP ; **Assembly Language Programming: Assembler directives:** ASSUME, DB, DD, DQ, DT, DW, END, ENDP, ENDS, EQU, EVEN, EXTRN, GLOBAL, GROUP, INCLUDE, LABEL, LENGTH, NAME, OFFSET, ORG, PROC, PTR, PUBLIC, SEGMENT, SHORT, TYPE [Refer Douglas and Hall book for above articles **Assembly Language Programming:** Sum of an array, factorial, largest / smallest from given array, sorting of numeric array, square root.

### **Unit IV: Input / Out Interfacing (with reference to 8086 Microprocessor):**

Introduction to I/O interface, I/O instructions, isolated and memory mapped I/O, basic input and output interfaces, handshaking, I/O port address decoding: decoding of 8-bit I/O addresses, decoding of 16 – bit I/O address; The programmable peripheral interface: basic description of 8255, programming the 8255, mode 0 operation, an LCD display interfaced to 8255, a stepper motor interfaced to 8255, Mode 1 strobed input, mode1 strobed output , Mode 2 bisectional operation

**PHYE-312 – Elective 1 (B1): Atomic Spectroscopy:**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

- a) The concept of the photon, however, emerged from experimentation with **thermal radiation**, electromagnetic radiation emitted as the result of a source's temperature, which produces a continuous spectrum of energies. More direct evidence was needed to verify the quantized nature of electromagnetic radiation. In this course, we describe how experimentation with visible light provided this evidence.
- b) This course addresses various aspects of spectroscopic analysis relevant to research and industry.
- c) Seeing that spectroscopy is a set of tools that can put be together in different ways to understand systems and solve chemical problems
- d) Understanding basic concepts of instrumentation, data acquisition and data processing.

**Learning Outcomes:**

After completing this course the student will be able to use spectroscopic methods for qualitative and quantitative analysis.

**Course Contents**

1. **Relativistic effect on Atomic Spectra:** Sommerfeld relativity correction, fine structure and spinning electron, observed hydrogen fine structure, fine structure of ionized helium line  $\lambda = 4686 \text{ \AA}$ , the Dirac electron in hydrogen atom, Sommerfeld formula from Dirac's theory.  
[Scope: Introduction to Atomic Spectra by H. E. White, Chapter IX] Lamb shift (qualitative)  
[Scope: Atomic Physics, Christopher J. Foot, page 40-41].
2. **Atoms in magnetic field:** Vector model of a one electron system in weak magnetic field, magnetic moment of bound electron, magnetic interaction energy, selection rules, intensity rules, Paschen Back effect, Paschen Back effect of a Principal series doublet, selection rules

for Paschen Back effect, The Zeeman and Paschen Back effects for hydrogen, Quantum mechanical model of an atom in a strong magnetic field.

[Scope: Introduction to Atomic Spectra by H. E. White, Chapter X]

- 3. Complex Spectra:** Regularities in atomic spectra of complex atom-The Rydberg Series relationship, Hartley law of constant doublet separation, Displacement law, Law of alternation of multiplicities. Terms in many electron atom - Terms arising due to L-S coupling, Terms in j-j coupling non-equivalent electrons system, Terms in equivalent electron system – Two s-electrons, Two p-electrons, Three equivalent p-electrons, Four equivalent p-electrons, Five equivalent p-electrons, Six equivalent p-electrons, Two equivalent d-electrons, Equivalent electrons in j-j coupling, Lande interval rule. Application of Lande Interval rule, Hund's rules, Pauli exclusion principle for  $p^2$ ,  $p^3$ ,  $p^4$ ,  $p^5$ ,  $d^2$  electrons.
- 4. X-ray Spectra:** Mosley's law, Absorption spectra, energy levels, selection and intensity rules (Burger - Dorgelo - Ornstein rules), regular and irregular doublet law, predicted structure in x-rays, x-ray satellites, explanation of x-ray absorption spectra.

[Scope: Introduction to Atomic Spectra by H. E. White, Chapter XIV]

## **PHYE-312 – Elective 1 (C1): Radioactivity and Nuclear Decay:**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials:12**

**Learning Objectives:** Nuclear physics is one of the most important topic of physics. This course is necessary as it gives the idea of important phenomenon of Radioactivity and various nuclear decays, the course will help the student for preparation of NET/SET and other competitive examinations. It should be taught as an Elective.

**Learning Outcomes:** This course is beneficial to students because it can help to understand the uses of radioactivity in determining age of earth, mountains, etc. The understanding of various nuclear decay is beneficial in radio physics / Chemistry and in the field of medical (Treating the cancer patients). The students can get job in medical diagnostic centers as well as they can do research in BARC and other institutions.

### **Course Contents:**

#### **Unit I: Radioactivity**

Introduction, Basic parameters of radioactivity, radioactive series, Induced radioactivity (Artificial radioactivity), radioactivity dating, The age of earth, Units of radioactivity, Radiation dosimetry.

#### **Unit II: Alpha Decay**

Introduction, Properties of alpha particle, Disintegration energy of alpha decay, Alpha Spectrum, Range of alpha-particles and Geiger–Nuttal law, Long range alpha-particles, Experimental methods for range of alpha-particles (Bragg and Kleeman method, Geiger-Nuttal method), Conservation laws in alpha decay, Gammows theory of alpha decay.

#### **Unit III: Beta Decay**

Introduction, Properties of beta-ray, Types of beta decay processes, Energetics of beta decay, Bucherer’s method for  $e/m$ , Beta ray spectra, Pauli’s Neutrino hypothesis, Fermi’s theory of beta decay, Selection rules in beta decay, Energy levels and decay schemes.

#### **Unit IV: Gamma Decay**

Introduction, Properties of gamma-ray, Selection rule, Multipolarity in gamma transitions, Life time of gamma active nuclei, Gamma rays spectra, Conservation laws in gamma emission, Internal conversion, Nuclear isomerism, Mossbauer effect, Interaction of gamma rays with matter.

## **PHYE-312 – Elective 1 (D1) : Crystallography:**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning objectives:** The objective of this course is to present the basic concepts needed to understand the crystal structure of materials. Fundamental concepts including lattices, symmetries, point groups, and space groups will be discussed and the relationship between crystal symmetries and physical properties will be addressed. The theory of X-ray diffraction by crystalline matter along with the experimental X-ray methods used to determine the crystal structure of materials will be covered. Application of X-ray diffraction electron diffraction and neutron diffraction will be briefly discussed.

**Students will be able to:** i) Describe what can be detected with X-ray crystallography ii) explain the impact of temperature iii) atom size, and impurities on the tests.

**Learning Outcomes:** Acquisition of the following skills: i) Ability to explain basic/fundamental crystallographic concepts ii) Ability to extort the relevant information from a crystallographic paper.iii) Ability to find specific tools for solution of a given crystallographic problems.

iv) An ability to relate their broad tutoring toward the understanding of the impact of engineering solutions in a global and societal context.

### **Course Contents:**

#### **Unit I: Crystal Binding: ( 12 Contact Hours)**

Crystal of inert gases, Van der Waals – London interaction, repulsive interaction, cohesive energy, ionic crystals, Madelung energy, Born-Mayer model, evaluation of Madelung constant for an infinite line of ions, binding in covalent, metal and Hydrogen bonded crystals, Atomic radii.

#### **Unit II: Crystallography and Crystal Physics: (12 Contact Hours)**

Principle of powder diffraction method, interpretation of powder photographs, indexing of powder patterns, accurate determination of lattice parameters, least square method, Synchrotron X-ray diffraction (SCXRD), applications of powder method, Diffraction by an ideal crystal, The Debye – Waller factor. External symmetry elements of crystals, influence of symmetry on physical properties, derivation of equivalent point position, experimental determination of space groups;

#### **Unit III: Defects and Alloys: (12 Contact Hours)**

Classification of defects, Point defects: Vacancy, Schottky, Frenkel Defects, Color Centres, Line Defects: Edge Dislocation, Screw Dislocation, Burger Vector, Alloys: diffusion, magnetic alloys and Kondo effect, Dislocation in Crystals: slip and plastic deformation, shear strength of single crystals, stress fields of dislocations, dislocation multiplication and slip, short and low range order in liquids and solids, liquid crystals, quasi crystals and glasses, low angle grain boundaries, dislocation densities, dislocation and crystal growth, whiskers.

#### **Unit IV: Semiconductor Devices: ( 12 Contact Hours)**

Intrinsic and extrinsic semiconductors, intrinsic and extrinsic carriers concentration, electrical conductivity and mobility and their temperature dependence, thermal electron power transport in semiconductors, Hall effect, Experimental determination of Hall coefficient, Semiconductor Devices: p-n junction, forward and reverse biasing, volt-ampere characteristic of p-n junction, Zener diodes, Tunnel Diode, Photodiode, Solar cells, Light emitting diode (LED), Thermistors and Batteries, Field effect Transistor(FET), Metal Oxide Semiconductor Field Effect Transistor (MOSFET), Quantum Dots (QDs), applications of semiconductors, Problems.

**Unit V: Tutorials, assignments and seminar presentations based on unit I, II, III and IV ( 12 Contact Hours)**

**PHYE-313 Generic Electives 2 (A2/ B2/ C2/ D2)**

**PHYE-313 – Elective 2 (A2) : Microwaves**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:** The themes dealt with in this paper:

1. Gain knowledge of microwaves, its features, different bands and its applications.
2. Analyze transmission line, their associated problems and applications. Also gain knowledge of the Smith chart for solving transmission-line problems
3. To Analysis and study characteristics of microwave tube Generators, Amplifiers and microwave Semiconductor of devices.
4. Obtain knowledge of microwave components such as tees, couplers, hybrid junctions, ferrite devices and different microwave antennas.
5. Impart knowledge of different microwave measurements like power, frequency, impedance, S-parameters and VSWR.

**Learning Outcomes (COs): At the end of the course the student should be able to:**

1. Able to design impedance matching network for any transmission line or system.
2. Able to analyze and find applications and limitations of microwave tube Generators, Amplifiers and semiconductor devices.

3. Able to discriminate different microwave components find applications and use it in supporting systems.
4. Able to Conduct experiments and interpret the data accordingly.
5. Able to apply theory and practical knowledge of microwaves for various microwave engineering in specific area.

**Course content:**

**Unit I: Introduction of Microwaves and Transmission line theory (12 Contact Hours)**

Microwave frequency, features, applications and bands. Distributed parameters, Basic transmission line equations and solution, Determination of alpha and beta for a transmission line. Distortion on a transmission line, conditions for distortion less line. Standing waves, standing waves ratio, quarter & half wavelength lines, Properties of lines of various lengths, Impedance matching by use of stubs, matched lines, Smith chart.

**Unit II: Microwaves Generators: (12 Contact Hours)**

Tubes: Two cavity Klystron, velocity modulation, mathematical analysis, performance and applications. Multi cavity klystron. Reflex klystron, operation, transit time, Relation between repeller voltage and frequency, Modes, Applications. Magnetrons, crossed electric and magnetic fields, RF structure of magnetron, oscillation mechanism in magnetron, travelling wave tube amplifier, backward wave oscillator.

**Microwave solid state devices:** MESFET, principle of operation, Gunn diode, background, Gunn effect, Mode of operations, Gunn oscillator modes, Transit time mode, Quenched and delayed domain modes, LSA mode. Gunn oscillator circuits, coaxial cavity waveguide cavity circuits.

**Unit III: Microwave Components and antennas: (12 Contact Hours)**

Waveguide tees, E- plane tee and H-plane tee, Hybrid junction. Directional coupler, two hole directional coupler, loop directional coupler, Isolators, Faraday's rotational isolator, applications, Circulator, Microwave network representations, S- Matrix theory of E, H, Directional coupler and magic tee.

**Microwave antennas:** Horn antenna, microwave dish antenna, lens antenna, slot antenna, broadband antenna.

**Unit IV: Microwave Measurements: (12 Contact Hours)**

Measurement of power by bolometer, bridge method, calorimeter, VSWR Measurement (High & low), Detector diodes and detector mounts, Detector output indicator, Impedance measurement by slot line and probe, Network analyzer, Measurement of scattering parameters, Frequency measurement by wave meter, Electronics techniques for frequency measurement, transfer oscillator and direct reading microwave counters.

**Unit V: Tutorials, assignments and seminar presentations based on unit I, II, III and IV (12 Contact Hours)**

**PHYE-313 – Elective 2 (B2): Molecular Spectroscopy****(Credits: 04; Contact Hours: 60)****Lectures: 48; Tutorials: 12****Learning Objectives:**

- Introduction to electronic spectroscopy of diatomic molecules
- study of vibrational course structure of electronic spectra of diatomic molecules; analysis of vibrational spectra of diatomic molecules and estimation of moment of inertia, force constant and bond length
- To understand the electronic structure, coarse and fine structure of energies of electronic states, of diatomic molecules
- To understand the vibrational, rotational motions and coupling of these motions by evaluating the vibrational and rotational constants of the electronic states
- To understand various coupling schemes
- To understand uncoupling phenomena like  $\Lambda$  type doubling and spin uncoupling
- Determination of term manifold of homonuclear and heteronuclear diatomic molecules
- To understand the symmetry properties of the electronic wavefunctions, the selection rules and allowed electronic transitions
- To understand the basic physics of Raman scattering of diatomic/polyatomic molecules; experimental techniques of Raman spectroscopy; analysis of Raman spectra for investigating the molecular structure

## Learning Outcomes:

The student will be able to:

- CO1 arrange the wavenumbers of band heads and band origin in the Deslandres table; identify various sequences and progressions in the band spectrum; analyze the electronic spectra of diatomic molecules, and estimate vibrational constants and vibrational energies; able to calculate: harmonicity and anharmonicity constants of the upper and lower electronic states, force constants the upper and lower electronic states
- CO2 explain various coupling schemes and uncoupling phenomena
- CO3 calculate the term manifold of homonuclear and heteronuclear diatomic molecules
- CO4 explain the symmetry properties of rotational levels of upper and lower electronic state
- CO5 explain the symmetry properties of rotational levels of lower electronic state
- CO6 explain the selection rules for electronic transitions ; draw the allowed electronic transitions
- CO7 describe the role of various parts of Raman spectrometer, analyze the Raman spectra of molecules, and determine their structure

## Course Contents:

### Unit I: Electronic Spectra of Diatomic Molecules:

Electronic energy and total energy, electronic energy and potential curves; stable and unstable molecular states, resolution of total eigen functions, resolution of total energy, Vibrational structure of electronic transitions: general formulae, examples; graphical representation, Deslandres table, progressions and sequences, evaluation of vibrational constants, Rotational structure of electronic bands. Band head formation and shading of bands. Combination relation and evaluation of rotational constant for bands without and with Q branches. Band origin determination. Isotope effect in electronic spectra

### Unit II: Coupling of rotation and electronic motion:

Classification of electronic states; multiplet structure, orbital angular momentum, spin, total angular momentum of the electrons; multiplets, symmetry properties of the electronic eigen functions, Hund's cases a, b and c, Uncoupling phenomena:  $\Lambda$  type doubling, Spin Uncoupling. Symmetry properties of rotational levels. Types of electronic transitions, selection rules, Study of  $^1\Sigma - ^1\Sigma$ ,  $^2\Sigma - ^2\Sigma$  and  $^1\Pi - ^1\Sigma$  transitions.

### Unit III: Determination of term manifold:

Separated atoms. (like and unlike atoms) Term manifold from electronic configuration. Pauli principle. Term of non-equivalent electrons. Molecular configurations of CO, C<sub>2</sub>, N<sub>2</sub>, AlO, BeO, BeH etc molecules. Types of binding. Homopolar, Heteropolar and Van der Waal.

#### **Unit IV: Raman Spectroscopy:**

Classical theory and quantum theory of Raman effect, Pure rotational Raman Spectra, Raman spectra of linear, symmetric top and asymmetric top molecules. Raman activity of vibrations, vibrational Raman Spectra. Rotational fine structure, polarization of light and Raman effect, degree of polarization, Vibration of spherical top molecules.

Structure determination from Raman and IR spectra,

Instrumentation: Raman spectrometer

#### **References:**

2. MOLECULAR STRUCTURE AND SPECTROSCOPY, by ARULDHAS, G. , Second Edition ,2004; ISBN: 978-81-203-3215-7, PHI Learning

### **PHYE-314 – Electives 2 (C2): Reactor Physics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48 ;Tutorials: 12**

**Learning Objectives:** The themes dealt with in this paper:

- Outline and brief description, including fundamentals of the different reactors like swimming pool (Apsara) type reactor, Zerlina type reactor etc.
- To enable the students to study the basic and advance concepts of Reactor Physics

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- To explain the basic properties of neutrons and their sources.
- Able to define the different types of detectors.
- To explain the strengths and weakness of different types of detectors.
- To describe Neutron Diffraction.
- Students will be able to study the basic and advance concepts of Reactor Physics will be able have job opportunities in BARC.
  
- **Course contents:**

#### **Unit I: The Neutron**

Discovery of neutron, neutron sources, basic properties of neutrons, wavelength of neutrons, high energy neutrons, measurements of energy of neutrons, time of flight method.

## **Unit II: Neutron Detections**

Detection of neutrons, detection of slow neutrons- foil- activation method, ionization chambers and counter tubes for the detection of slow neutrons, Scintillations for the detection of slow neutrons, fission chambers for detection of thermal neutrons, detection of fast neutrons.

## **Unit III: Neutron Diffraction**

Neutron diffraction from crystal, reflection for slow neutrons from mirrors, mechanical velocity selectors, measurement of neutron cross-section as a function of energy, cold neutrons and their isolations, neutron electron interaction, decay of neutrons.

## **Unit IV: Physics of Nuclear Reactors**

Thermalization of neutrons, dynamics of elastic scattering of neutrons, angular distribution of neutrons, diffusion of thermal neutron, Fermi age equation, condition of criticality of a reactor, critical equation of a reactor, rectangular parallelepiped reactor.

Types of Nuclear reactors : Spherical reactor, reactor in the shape of a cylinder, Physical processes in a reactor, control of reactors, nuclear fuel conversion, nuclear materials employed in reactors, moderators, some important reactors, Swimming pool ( Apsara ) type reactor, Zerlina type reactor.

## **References:**

5. The elements of nuclear reactor theory, Glastone and Edund.
6. Introduction to Nuclear Engineering, Murry.

## **PHYE-313 – Elective 2 (D2) : Electrical Properties of Solids and Superconductivity**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:** The course aims at giving the students,

- In depth knowledge and know-how within the theory of superconductivity in order to understand and describe the principles behind various superconducting applications.
- Distinguish between perfect conduction and perfect diamagnetism, and give a qualitative description of the Meissner effect, describe different theories of superconductivity and their ranges of validity.
- Get familiarized with the types of polarization of dielectrics in static and alternating electric fields.
- Acquiring of knowledge concerning the electrical behaviour of dielectric and ferroelectric materials. Will be able to experimentally investigate ferroelectric and dielectric materials.

**Learning Outcome:** At the end of the course the student will be able to

- Describe different theories of superconductivity and basic properties of superconductors.
- Explain type-I and type-II superconductivity based on thermodynamic calculations of the Gibbs free energy for a superconductor.
- Will learn to understand the relationship between material structure and electrical properties of materials.
- Will acquire knowledge about different types of dielectric and ferroelectric materials.
- A student can develop research/teaching career in the field of Superconductivity/ Dielectrics.

### **Course Contents:**

#### **Unit I: Dielectric Properties of Solids**

Fundamental definitions, Local field, Clausius- Mossotti relation, Polarization mechanisms in dielectrics: induced, orientational, electronic, ionic, interfacial and lattice polarizations; combined mechanisms, frequency and temperature effects on polarization, Classical theory of electronic polarizability, dipolar polarizability. Langevin's theory of dipolar polarizability dielectric loss, dielectric breakdown, determination of dielectric constant, properties and different types of insulating materials, Debye theory, Onsager equation, Applications.

#### **Unit II: Ferroelectric properties of Solids**

Fundamentals, Curie-Weiss law, Classification of ferroelectric materials, Theory of spontaneous polarization of BaTiO<sub>3</sub>, antiferroelectricity and ferroelectricity, Ferroelectric domains, Piezoelectricity, Pyroelectricity, Applications

### **Unit III: Basic properties of Superconductors**

Some fundamental Phenomena associated with Superconductivity (Zero resistance, persistent currents, superconducting transition temperature  $T_c$ , isotope effect, perfect diamagnetism and Meissner effect, penetration depth and critical field, Characteristics Length,). Type-I and Type-II Superconductors, Intermediate states, mixed states, Supercurrents and Critical Currents., Quantization of Magnetic Flux. Thermodynamics of superconducting transition: First order and second order transition, specific heat above and below  $T_c$ , thermal conductivity;

### **Unit IV: Theories of Superconductivity**

London Equations, BCS theory: Coherence of the BCS Ground State and the Meissner-Ochsenfeld Effect ,Electron -Electron Interaction via Lattice Cooper Pairs, BCS Wave function; Tunneling phenomenon, energy level diagram, ac And dc Josephson Effects, quantum interference. Novel High Temperature superconductors, Applications.

**PHYE-314 – Electives 3 (A3/ B3/ C3/ D3/E3/F3/G3/H3/I3/J3) (Any One)**

**PHYE-314 – Electives 3 (A3): Industrial Electronics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48 ;Tutorials: 12**

**Learning Objectives:**

- To get an overview of different types power semiconductor devices and their switching characteristics.
- To learn about types of operations.
- To learn about types of power converters.
- To learn about dc converters.

**Learning Outcomes (COs):** At the end of the course, students will be able to:

- CO-1** Explain the operation of SCR, UGT, PUT and its related circuits.
- CO-2** analysis of UGT, PUT oscillators
- CO-3** discuss working of controlled half wave and full wave rectifiers with different types of load
- CO-4** discuss principle and working of different types of chopper circuits
- CO-5** design the different types of circuits using SCR, UGT and PUT for various applications
- CO-6** discuss the need for parallel and series operations of power devices

**Course content:**

**Unit I: Thyristor: Principles and Characteristics: (12 Contact Hours)**

Thyristor family, Principle of operation of SCR, Two transistor model of SCR, Thyristor Construction, Turn on methods of Thyristor, Dynamic turn on switching characteristics, Turn off mechanism. Gate Triggering Circuits: Resistance firing circuit, Resistance and capacitance firing circuit, Resistance capacitance full wave trigger circuit, Unijunction transistor, Basic operation, UJT relaxation oscillator, UJT as an SCR trigger, Synchronized UJT triggering. Programmable Unijunction transistor, PUT as an SCR trigger.

**Unit II: Series and Parallel operation of Thyristors : (12 Contact Hours)**

Series operation of Thyristors, Need for equalizing Network, equalizing network design, Triggering of series connected Thyristors, Parallel operation of Thyristors, Methods of ensuring proper current sharing, triggering of Thyristors in parallel .

**Unit III: Phase Controlled Rectifiers: (12 Contact Hours)**

Phase angle control, Single-phase half-wave controlled rectifier: with resistive load, with inductive load, effect of freewheeling diode, Single-phase full-wave controlled rectifier: Mid point converter (M-2 connection): with resistive load, with inductive load, effect of freewheeling diode.

**Unit IV: Choppers: (12 Contact Hours)**

Introduction, Principle of chopper operation, Control strategies: Time-Ratio Control, constant frequency system, variable frequency system, Current-limit Control; Step-Up Choppers, Step-Up/down chopper, Jones chopper (design not expected).

**Unit V: Tutorials, assignments and seminar presentation based on unit I to IV.

**PHYE- 314 – Electives 3 (B3) : Modern Trends in Spectroscopy**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

- a) Acquiring of knowledge concerning the electrical behavior of dielectric materials.
- b) The students become accustomed with the nuclear magnetic resonance (NMR) methods.
- c) The student will develop their abilities to investigate polyatomic molecules by NMR spectroscopy.
- d) Imparting knowledge based on fundamentals of physical principles and measurement methods used for characterization.

**Learning Outcomes:**

- a) The student will be able to analyze the molecular spectra.
- b) The student will be able to analyze the FTIR spectra of thin film and molecules and determine their structure.
- c) The student will be able to analyze the NMR spectra of molecules, and determine their structure.
- d) The student will be able to get the information about a particular substance using ESR, NMR, Raman and FTIR.

**Course Contents**

**1. ELECTRONS SPIN RESONANCE SPECTROSCOPY:**

Principle of ESR, ESR Spectrometer, Total Hamiltonian, Hyperfine Structure, ESR Spectrum of Hydrogen Atom, ESR Spectra of Free Radicals in Solution- Energies of Radicals with One Unpaired Electron, CH<sub>3</sub> Radical, Benzene Anion (C<sub>6</sub>H<sub>6</sub><sup>-</sup>), etc.

[Scope: Molecular structure and spectroscopy by G Aruldhas, Prentice Hall of India, Chapter 11].

**2. NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY:** Introduction, Magnetic Properties of Nuclei, Resonance Condition, NMR Spectrometer, Relaxation Processes and their Mechanism. Bloch Equation, Fourier Transformation, Dipolar Interaction, Chemical Shift. Indirect Spin Interaction. Spectrum of Spin <sup>1</sup>/<sub>2</sub> AB System. Interpretation of Few NMR Spectra.

[Scope: Molecular structure and spectroscopy by G Aruldhas, Prentice Hall of India, Chapter 10].

### 3. **FOURIER TRANSFORM INFRARED SPECTROSCOPY:**

Introduction, Historical Background, FT-IR Spectroscopy, Basic Integral Equation, Attenuated Total Reflectance, Experimental Setup, Advantages, Other Aspects, Applications, Surface Studies, Characterization of Optical Fibers, Vibrational Analysis of Molecules, Study of Biological Molecules, Study of Polymers.

[**Scope:** Handbook of Applied Solid State Spectroscopy, by D. R. Vij, Springer, chapter 9].

### 4. **NONLINEAR SPECTROSCOPIC PHENOMENA:** Nonlinear Raman Phenomena (Preliminaries), Hyper Raman Effect, Stimulated Raman Scattering, Inverse Raman Effect, Coherent Anti-Stokes Raman Scattering, Photo-acoustic Raman Scattering, Multi-photon Spectroscopy.

[**Scope:** Molecular structure and spectroscopy by G Aruldas, Prentice Hall of India, Chapter 15].

#### **Books:**

1. Dielectric Properties and Molecular Behaviour, by Nora E. Hill, A. H. Price and Mansel Davies, ISBN 10: [0442034113](#) ISBN 13: [9780442034115](#) Published by Van Nostrand Reinhold Company (1969) London.
2. Handbook of Applied Solid State Spectroscopy, by D. R. Vij, ISBN: 978-0-387-32497-5 (Print) 978-0-387-37590-8 (Online) DOI 10.1007/0-387-37590-2, 2006 Springer.
3. MOLECULAR STRUCTURE AND SPECTROSCOPY, by ARULDHAS, G. , Second Edition ,2004. ISBN: 978-81-203-3215-7, PHI Learning.

### **PHYE-313 – Elective 3 (C3) : Nuclear Reactions and Nuclear Energy**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:** The themes dealt with in this paper:

- This course gives basic foundation to specialization in nuclear physics and applications, including power production through fission and fusion reactors.
- The course is an advanced course and requires special efforts. So, it can be taught as an elective course only.
- The course will help the student for preparation of NET/SET and other competitive examinations.
- The course is most suitable in III<sup>rd</sup> semester, because this knowledge is essential for understanding the contents of the next following course “radiation measurements and Nuclear dosimetry” to be covered as elective course in IV<sup>th</sup> semester.

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- After completing this course the student will be to prepare to understand the scope and possibilities of studies in nuclear physics for research career as well as in industry.
- This course is prerequisite to the second elective course as mentioned above for IV<sup>th</sup> semester.

### **Course Contents :**

#### **Unit I: General Features of Nuclear Reaction**

Introduction, Conservation laws in nuclear reactions, Energetics and Q-Value of nuclear reaction, Nuclear transmutation, Nuclear reaction cross-section, Partial cross-section, Determination of cross-section, partial wave analysis for reaction cross-section, Breit-Wigner dispersion formula, Level width.

#### **Unit II: Nuclear Reaction Mechanism**

Types of nuclear reaction, Compound Nucleus, Theory of nuclear reaction, Characteristics of pre-equilibrium reaction, Direct reaction, Theory of Stripping and Pick-up reaction, Continuum theory of nuclear reaction, Statistical theory of nuclear reaction.

#### **Unit III: Nuclear Fission**

Introduction, Nuclear fission, Types of fission, Emission of nuclear fission, fission of fertile material, Distribution of mass of fission products, Energy released in fission, Distribution of energy of fragments, Neutrons released in fission, Prompt and delayed neutrons, Spontaneous fission, Theory of fission (Liquid drop model), Nuclear chain reaction, Four factor formula, Nuclear Reactor, Breeding of fuel, Classification of Nuclear Reactor.

#### **Unit IV: Nuclear Fusion**

Introduction, The plasma, Fusion reaction in the plasma, Conditions for maintain fusion reaction, Stellar energy, Sources of stellar energy, Carbon-Nitrogen cycle, Controlled thermal nuclear reactions, The eight synthesizing processes.

### **PHYE-314 – Electives 3 (D3); Physics of Nanomaterials**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48 Tutorials: 12**

**Course objectives:** Students should be capable to,

- Student should be able to apply basic knowledge of physics and materials science to develop proficient understanding of how nanoscale properties affect macroscale performance and enable new technologies.
- Expand basic knowledge in the synthesis of nanomaterials, their properties and characterization.
- Portray the physical properties of nanomaterials resulting from constraints on their nanoscale organization.
- Confer how to analyze structure-function relationships and understand nanoscale features of materials.

**Course outcomes:** At the end of the course the student will acquire,

- Insight into how macroscopic properties can be changed via molecular level engineering and nanoscale manipulation.
- Knowledge about the techniques of how to synthesize nanomaterials and will understand their nanoscale properties.
- Adequate knowledge of important characterization techniques and will be able to analyze obtained data.
- fundamental knowledge of nanotechnology principles and applications
- A student can develop research career in the field of Nano technology.

**Course Contents:**

**Unit I: Quantum Tunneling and Confinement Free particle:** Concepts of nanosized particles, Size and Dimensionality Effects, Energy levels of a particle - Infinite square well in one- two- and three dimensions - Density of states, Quantum confinement - Penetration of a barrier - Tunnel effect. Quantum wells- Quantum wires and Quantum dots. Carbon clusters & Fullerenes; Carbon Nanotubes: Structures & Electronic Properties, Application of carbon Nanotubes.

**Unit II: Synthesis of nanomaterials:** Top down and Bottom up concepts, Growth techniques of nanomaterials: Plasma Arc discharge, Sputtering, Evaporation, physical vapor deposition, Chemical vapor deposition, Pulsed Laser deposition, Molecular beam epitaxy, Sol-gel process, Co-precipitation process.

**Unit III: Characterization techniques:** XRD, Scanning Probe Microscopy (SPM), Scanning Tunneling Microscopy (STM), Atomic Force Microscopy (AFM), Electron Microscopy: Scanning Electron Microscopy (SEM & FESEM), Transmission Electron Microscopy (TEM).

**Unit IV: Properties and applications of nanomaterials:** Physical Properties of Nanomaterials; i) Electrical ii) Thermal. iii) Magnetic. iv) Optical. v) Mechanical. Applications in medicine and electronics.

### **PHYE-314 – Electives 3 (E3); X ray Diffraction**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48 Tutorials: 12**

### **Learning Objectives:**

- To understand the most powerful source of plane and circularly polarized x rays.
- To have a prior training before research activities on INDUS 2 or any SR in the world.

### **Learning Outcomes:**

- Understanding research activities at SR INDUS
- The practice of x ray data analyses

**Course Contents:**

**Unit I - X ray Diffraction-1:** Limitations of x rays from tubes as regards x ray diffraction studies, synchrotron radiation as source of x rays: Production and properties of radiation from storage rings, wigglers and undulators, Insertion devices. types of polarized x rays using SR, INDUS I and INDUS II, Diffraction using SR: using plane polarized x rays and using circularly and elliptically polarized x rays (X ray Circular Magnetic Dichroism XCMD): methods of obtaining monochromatic x rays, polarized x rays; Detectors: high flux ( $> 10^8$  photons/sr/sec), very low time structure ( $\sim 10^{-9}$  sec or less)

**Unit II- X ray Diffraction-2:** X ray diffraction data analysis of various types of samples : cubic, tetragonal, hexagonal, etc, determination of various parameters like lattice parameters, near neighbor distances, strain, etc. Pair distribution Function (PDF) analysis

**Unit III- Emission Spectroscopy:** Continuous and characteristic X-ray spectra, Energy level diagram. Dipole, forbidden and satellite lines. Regular and irregular doublets. Relative intensity of X-ray lines. Chemical effects in X-ray spectra; Experimental techniques of wavelength and energy dispersive X-ray spectroscopy: Bragg and double crystal spectrometers. Focussing spectrographs: Cauchois, Johann and Johanson types. Tangential incidence grating spectrographs.

**Unit IV- Absorption Spectroscopy:** Absorption of X-rays. Physical process of X ray absorption. Measurement of X-ray absorption coefficients. Units of dose and intensity, X-ray fluorescence. Auger effect. Fluorescence yield. Auger electron spectroscopy, Photoelectron spectroscopy, Chemical effects in X-ray absorption spectra. White line, Chemical shifts of absorption edges, Fine structures (XANES and EXAFS) associated with the absorption edges and their applications. Soft X-ray spectroscopy of metals and alloys, Applications to semiconductors and insulators

**PHYE-314 – Electives 3 ( F3 ) : Thin film and Vacuum Technology****(Credits: 04; Contact Hours: 60)****Lectures: 48 ; Tutorials: 12****Learning Objectives:**

- This program will help prepare students to work as technicians in industries which rely on vacuum-based processes to create and manufacture products.
- Individuals studying vacuum technology will learn skills in building, validating, operating, maintaining, and troubleshooting vacuum-based equipment as well as providing advice on the use of this equipment and the processes supported by this technology. Positions may include responsibilities associated with research and design, operations, quality control, technical writing, and technical sales.

**Learning Outcome:**

- Employment opportunities span a variety of industries such as semiconductor, micro electromechanical systems (MEMS), glass, optics, light-emitting diodes (LEDS), solar cells, vacuum-based equipment and other industries which used thin film coating processes.
- The duties of a technician include building, validating, operating, maintaining, and troubleshooting vacuum-based equipment as well as providing advice on the use of this equipment and processes supported by this technology.
- The Vacuum and Thin Film Technology program prepares a student to work as a technician in industries which rely on vacuum-based processes to create and manufacture products.
- Employment opportunities span a variety of industries such as: Semiconductor, Microelectromechanical systems (MEMS), Glass, Optics, Light-emitting diodes (LEDS), Solar cells, Vacuum-based equipment, Other industries which use thin film coating processes

**Course contents:**

**Unit I:**

Thermodynamics and Thin Film growth, Vacuum Technology: Gas Laws, Kinetic Theory of Gases, Conductance and Throughput, Gas Sources in a Vacuum Chamber, Vacuum Pumps.

**Unit II:**

Physical Vapor Deposition: Sputtering (Plasma Physics (DC Diode), rf Plasmas, Magnetic Fields in Plasmas, Sputtering Mechanisms) and Evaporation.

**Unit III:**

Chemical Vapor Deposition: Mechanisms, Materials, Chemistries, Systems. Module-V Etching: Wet Chemical Etching (Mechanisms, Materials and Chemistries), Dry Plasma Etching/Reactive Ion Etching (Mechanisms, Materials and Chemistries).

**Unit IV:**

FILM Formation and Structure: Capillarity Theory, Atomistic Nucleation processes, Cluster Coalescence, Grain Structure of Films. Thin Film Characterization: Structural, optical, electrical and magnetic

### **PHYE-314 – Electives 3 (G3): Methods in Theoretical Physics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12 hours**

**Learning Objective:** The themes dealt with in this paper:

- To provide a high quality education which prepares students for further study and research in physics and for a wide range of career opportunities in industry .
- To provide a high quality mathematical models and abstractions of physical objects and systems to rationalize, explain and predict natural phenomena.
- To provide students with a training in the mathematical techniques which underpin physics, and to offer them the opportunity to develop related skills and knowledge to a high level.
- To provide students with knowledge and skills this will equip them to start a doctorate.

**Learning outcomes:**

- Demonstrate enhanced ability to address appropriate physical problems using theoretical analysis and computational skills.
- To provide opportunities for scientific study and creativity within a global context that will stimulate and challenges students.
- To provide body of knowledge, methods and techniques that characterizes science and technology.
- To develop an ability to analyze, evaluate and synthesize scientific information.

**Course content:**

**Unit I: Methods for obtaining solutions of linear and nonlinear equations and their convergence:**

Graphical method, interval bisection method, Newton Raphson method, secant method, method of false position, Solution of simultaneous equations: Gauss elimination, pivoting, Gauss-seidel Iterative method, LU decomposition. **(12 Lectures)**

**Unit II: Curve fitting:** Linear regression, polynomial regression, nonlinear regression using exponential functions. Fitting curve of the form  $y = ae^{bx}$ .

Numerical integration: Trapezoidal rule, Simpson's 1/3 rule, Simpson's 3/8 rule, Newton-Cotes formulae, Gaussian Quadratic formula. **(12 Lectures)**

**Unit III: Finite differences:** Forward Difference, backward difference, central difference, Interpolation with equally spaced point: Newton forward interpolation, Newton backward Interpolation, central difference interpolation, Gauss forward interpolation, Numerical differentiation: using derivative of Newton forward, backward and central difference interpolation formulae. **(12 Lectures)**

**Unit IV: Numerical solution by ordinary differential equations: Preliminaries and classification:** General form of ordinary differential equation(ODE), solution of an ODE, Order and degree of ODE, linear and nonlinear differential equation, Initial value problem, boundary value problem, Euler method, Runge-Kutta second order method, Runge-Kutta fourth order method, Predictor –Corrector method: Adams-Moulton's method, Milnes method. Finite Element method : Application to two dimensional problems. **(12 Lectures)**

**PHYE-314 – Electives 3 (H3): Communication Electronics**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

1. The fundamentals of basic communication system, detailed about the amplitude modulation.
2. Need of modulation, modulation processes and different amplitude modulation schemes.
3. Different frequency, phase and pulse modulation schemes.
4. Different demodulation methods.
5. Need of sampling and different sampling techniques.

## 6. Generation and detection of pulse modulation techniques and multiplexing

### **Learning Outcomes:**

After successful completion of the course students will be able to

1. Understand different blocks in communication system and how noise affects communication using different parameters.
2. Distinguish between different amplitude and frequency modulation schemes with their advantages, disadvantages and applications.
3. Analyze detection of AM and FM signal.
4. Identify different pulse modulation systems and use of their circuits in communication.
5. Able to understand how to sample analog signal and recover original signal.

### **Course Contents**

- 1. Modulation:** Amplitude modulation: Power in AM Wave, Current relation, Vector Representations. Amplitude modulator circuits, Non-linear Modulation, Linear Modulators Circuits, Collector modulation, Double Side band Suppressed Carrier System, Balanced Modulator, Ring Modulator, Single Side band Suppressed Carrier, Vestigial Side-band Systems.
- 2. Frequency Modulation:** Frequency Spectrum of an FM wave, Vector Representations, Narrow Band FM, Wide Band FM, F.M. circuits: Varactor Diode Modulation, Reactance Tube Modulator, Transistor Reactance Modulator. Phase Modulation: Phase Modulation Circuit, Interference in AM and FM Systems. Pulse Modulation: Pulse amplitude Modulation, Pulse Width Modulation, Pulse position Modulation.
- 3. Demodulation:** AM Detectors: Envelop Detection, Practical Diode Detectors, Input Resistance of a Diode Detector, V.S.B. Demodulators, Synchronous Detector, Phase – Locked Loop (PLL), FM Discriminators, Foster-Seeley Discriminator, Phase – Locked Loop (PLL) frequency Discriminator, Demodulation of Phase modulated waves
- 4. Pulse and Digital Communication:** Sampling theorem, Pulse Amplitude modulation, Natural sampling, Flat-top sampling, Spectrum of flat top sampling, A PAM modulator circuit, Demodulation of PAM signals, A PAM demodulator circuit, A pulse time modulation, Generation of PTM signals, Demodulation of PTM signal, bandwidth of PTM signals, PCM, Bandwidth of PCM system, Delta modulation and Adaptive delta modulation and detection. Digital modulation techniques: ASK, FSK, PSK or BPSK, QPSK, DPSK, MSK. Telephone: Telephone Instruments, Transmitters, receivers, Telephone set, Exchanges (Local, Central and Electronic).

**Books:**

1. Principle of Communication Engineering Anokh Singh and A K Chhabra (S. Chand & Company).
2. Electronic Communications Dennis Roddy and John Coolen (Pearson).
3. Communication Systems (Analog and Digital) R P Singh and S D Sapre. (TMH).
4. Electronic Communication Systems Kennedy and Davis ( TMH )

**PHYL-321: Lab course 5 (Based on Electives A1/ B1/ C1/ D1)****PHYL-321 – Lab course 5 (A1): 8086 Microprocessor and interfacing : Credits 3****Learning Objectives:**

1. To facilitate the students to understand
  - a) The concepts of microprocessor and assembly language programming.
  - b) The concept of interfacing devices at laboratory as well industrial level
2. To provide an opportunity to the students to enter into entrepreneurship.

**Learning Outcome:** Students will be able to learn

- a) Microprocessor architecture, physical configuration of memory, logical configuration of memory, microprocessor programming and interfacing.
1. Students will be capable to perform following job
    - a) Industrial automation using 8086 interfacing and programming.
    - b) Start his / her own small scale industry for manufacturing microprocessor based automated devices.
  2. Students will have option to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline.

**Experiments using 8086 Kit**

1. Data transfer, addition, subtraction, multiplication, division and sum of series
2. Factorial and square of the number
3. Sorting of data (ascending / descending), square root of a number
4. Arithmetic mean of N- numbers and sum of square of Numbers
5. Interfacing of SPDT switches and 7 segment display as a position encoder / decoder
6. Interfacing of stepper motor
7. Interfacing of DC motor
8. Interfacing of DAC to generate ramp wave, triangular wave and square wave.
9. Interfacing of 8-bit ADC
10. Interfacing of LCD display

**Experiments Using 8086 Assembler**

11. Data transfer, addition, subtraction, multiplication, division and sum of series
12. Factorial and square of the number
13. Sorting of data (ascending / descending), square root of a Number
14. Arithmetic mean of N- numbers and sum of square of Numbers

**Note: Students should perform any eight experiments.**

### **PHYL-321 – Lab course 5 (B1) : Atomic Spectroscopy : Credits 3**

#### **Learning Objectives:**

- a) Knowledge of absorption and emission spectra
- b) Study of various types of excitation mechanisms and excitation sources  
The student will get a training for using state of the art computer interfaced data acquisition system in spectroscopy laboratory for recording the atomic emission spectra
- c) Analysis of recorded atomic spectra
- e) Study the effect of external electromagnetic fields on the atomic spectra
- f) Application of ESR spectroscopy

**Learning Outcomes:** The student will be able to:

- |      |   |
|------|---|
| CO1  | perform DC arc excitation of Fe                             |
| CO2  | perform DC arc excitation of Cu                             |
| CO3  | perform DC arc excitation of Zn                             |
| CO4  | perform DC arc excitation Brass                             |
| CO5  | record the spectra of elements using HR4000 spectrometer    |
| CO6  | excite the emission spectra using gas discharges            |
| CO7  | excite the inert gases                                      |
| CO8  | record the absorption spectrum of the Sun                   |
| CO9  | arrange the Zeeman effect setup and record the splitting    |
| CO10 | use ESR spectrometer for determining earth's magnetic field |

#### **Course Contents:**

1. Record the spectrum of Hydrogen using HR 4000 spectrometer and determine Rydberg constant
2. Record the spectra of (arc sources) iron using HR 4000 Spectrometer
3. Record the spectra of (arc sources) copper using HR 4000 spectrometer
4. Record the spectra of (arc sources) zinc using HR 4000 spectrometer
5. Record the spectra of (arc sources) brass using HR 4000 spectrometer
6. Record the spectra of ( gas discharge sources) Hg using HR 4000 spectrometer
7. Record the spectra of ( gas discharge sources) Cd using HR 4000 spectrometer
8. Record the spectra of (inert gases) Ne using HR 4000 spectrometer
9. Record the spectra of (inert gases) He using HR 4000 spectrometer
10. To verify the line spectra of calcium and to verify the Landed interval rule
11. To verify the Landed interval rule for the sharp series lines of Zinc

12. Record the absorption spectrum of the Sun using HR 4000 spectrometer and identify the elements in the spectrum
13. Study of hyperfine structure using Zeeman effect
14. Study of normal Zeeman effect and calculation of  $e/m$ .

**References:**

1. ATOM, LASER AND SPECTROSCOPY by THAKUR, S. N. , RAI, D. K. , SECOND EDITION , 2010 ; ISBN: 978-81-203-4832-5.

**Note: Students should perform any eight experiment**

**PHYL-321 – Lab course 5 (C1) Nuclear Physics ;Credits 3**

**Learning Objectives:**

- a) Recording the pulse height spectra using latest gamma ray spectroscopy system.
- b) Analysis of recorded pulse height spectra.
- c) Study of various types of gamma ray sources.
- d) Study the characteristics of Geiger-Muller (G-M) counter .

**Learning Outcomes:**

- a) The student will get a training for using state of the art data acquisition system in Nuclear Physics laboratory
- b) The student will get a training for analysis of recorded pulse height spectra.
- c) The student will be able to perform various kinds of experiments using GM and Scintillation counter.
- d)

**Course Contents:**

1. To study characteristics of Geiger-Muller (G-M) counter.
2. Determination of dead time of Geiger-Muller (G-M) counter (Two source method).
3. Determination of dead time of Geiger-Muller (G-M) counter (Absorber method).
4. To study absorption of beta particles in matter.
5. Verification of the Inverse Square Law.
6. Window thickness of a Geiger-Muller (G-M) counter.
7. Window thickness of a Geiger-Muller (G-M) counter (Inverse Square Law).
8. Shelf ratios of a sample holder.
9. Determination of Efficiency of a Geiger-Muller (G-M) counter.
10. Energy dependence of Geiger-Muller (G-M) counter efficiency.
11. Determination of beta decay energy.
12. Relationship between thickness of absorber and backscattering
13. Shielding effect of radiation penetrability
14. Strength of a beta-source
15. Determination of Half-Life of unknown sample

16. Half-life of  $^{40}\text{K}$ .
17. Statistics of radioactive measurements.
18. Poisson distribution of radioactive measurements.
19. Gaussian distribution of radioactive measurements.
20. Chi-Square test of Geiger-Muller (G-M) counter.
21. Study of Mossbauer spectra of magnetic materials.
22. Statistical aspects of radioactivity measurements.
23. Beta backscattering as a function of atomic number.
24. Determination of the air borne activity.
25. Secular equilibrium.
26. Transient equilibrium.

**Note: Students should perform any eight experiments.**

### **PHYL-321 – Lab course 5 ( D1) : CRYSTALLOGRAPHY: Credits 3**

#### **Experiments on Crystallography:**

##### **Learning Objectives:**

- a) To facilitate the students to understand the concepts of structure of the materials
- b) identification of materials using Energy band gap concept
- c) To provide an opportunity to the students to enter into entrepreneurship.

##### **Learning Outcomes:**

- a) Students will be able to learn
  - i) Hall coefficient of the given semiconducting materials.
  - ii) Specific heat of graphite
  - iii) Crystallographic parameters, analysis of the obtained XRD data
  - iv) Grain Size, thickness of the materials
- c) Students will be capable to perform following job
  - i) Students will have option to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline.

##### **Course Contents:**

1. Determination of energy band gap of semiconducting material (Thermister) by Bridge method.
2. Measurement of Hall coefficient of a given sample..
3. Energy band gap of a P-N junction

4. To measure the ionic conductivity of ionic solids and to determine activation energy
5. Variation of specific heat of solid with temperature
6. To determine the coefficient of thermal conductivity
7. Determination of velocity and wavelength of ultrasonic waves.
8. Study of crystal structure by Powder method front reflection, back reflection (measurement of lattice parameter and indexing of powder photograph / X ray powder diffractometer data cubic, tetragonal, orthorhombic)
9. Interpretation of transmission Buare photograph
10. Determination of orientation of crystal by back reflection Laue method
11. Rotation / Oscillation photograph and their interpretation
12. Determination of particle size using X-ray powder method
13. Porosity determination of semiconducting material.
14. Structural analysis of thin film by XRD
15. Study the dispersion relation for monoatomic Lattice.
16. Study the dispersion relation for diatomic Lattice.

**Note: 1) Other experiments may be added as per the availability of instruments.  
2) Students should perform any eight experiments.**

### **PHYL-322: Lab course 6 (Based on Electives A2/ B2/ C2/ D2)**

### **PHYL-322 – Lab course 6 (A2) : Microwave and communication Electronics: Credits 3**

**Learning Objectives:** The themes dealt with in this paper:

- 1** 6. Gain knowledge of microwaves, microwave components and verify the relationship between frequency and wavelength experimentally.
- 2** 7. Experimental verification of the characteristics of Gunn and Klystron oscillators as microwave generators.
- 3** 8. Determine the plane pattern and beam width of microwave horn antenna and study the inverse square law with the same.
- 4** 9. Measure voltage standing wave ratio, S-parameters, Detector law, dielectric constant of solid and liquid with microwave bench setup.
- 5** 10. Gain knowledge of communication and verify how the signal is transmitted and detected with different electronic circuits like PAM, PWM, PPM, FSK, and PL

**Learning Outcomes (COs): At the end of the course the student should be able to;**

- CO-1** Understand the working use of all microwave components that may be used in a microwave X-band setup.

- CO-2** Assemble the bench as per the experimental requirement.
- CO-3** Obtain output power and perform experiment satisfactorily.
- CO-4** Conduct experiments smoothly, safely and interpret the data accordingly.
- CO-5** Apply practical knowledge of microwaves for other applications and research for finding basic properties of materials at microwave frequency.

**Course contents:**

1. Demonstrate the relationship between frequency ( $f$ ), wavelength ( $\lambda_0$ ) in free space and Wavelength in waveguide ( $\lambda_g$ )
2. Reflex Klystron Characteristics – Mode diagrams, ETR and ETS
3. Gunn Diode Characteristics; I-V Characteristics, Power versus bias characteristics and Power-frequency characteristics
4. Microwave Horn Antenna E-H Plane pattern and Beam width
5. Study of square law behavior of microwave crystal detector and hence to determine Operating range and detection frequency
6. Study of high and low VSWR and impedance measurements using Smith chart.
7. Measurement of S- parameters of a) E-Tee b) Magic Tee c) Directional coupler.
8. Determination of dielectric constant of solids – Two point method
9. Determination of dielectric constant of liquids – Robert-Von Hippel method
10. Study of Faraday's rotational principle
10. Study of PAM and its detection
11. Study of Balance modulator using IC 1596
12. Study of FSK modulation and detection
13. Study of PPM and detection
14. Study of PLL
15. Study of PWM and detection
16. Reflection and refraction in microwaves.
17. Interference and diffraction in microwaves.
- 18.

**Note: Students should perform any eight experiments.**

**PHYL-322 – Lab course 6 (B2) : Molecular Spectroscopy:**  
**Credits 3**

**Learning Course Objectives:**

- Thermal and DC electric field excitation of molecular spectra
- Recording the molecular spectra using latest computer interfaced instruments
- Vibrational analysis of the recorded molecular spectra and calculation of vibrational constants of upper and lower electronic states and estimation of force constants
- Rotational analysis of the recorded molecular spectra and calculation of rotational constants of upper and lower electronic states and estimation of bond lengths
- Understanding of Morse potentials of diatomic molecules
- Estimation of dissociation energy of I<sub>2</sub>.
- Understanding the fundamentals and instrumentation of NMR spectrometer; analysis of NMR spectrum

**Course Outcomes:**

The student will be able to:

- |     |  |
|-----|--|
| CO1 | Record the molecular spectrum using HR4000 spectrometer by DC arc excitation   |
| CO2 | identify various sequences in the band spectrum and arrange the wavenumbers of band heads in the Deslandres table  |
| CO3 | Perform vibrational analysis and calculate vibrational constants of the upper and lower electronic states. Calculate force constants the upper and lower electronic states |
| CO4 | Perform rotational analysis and calculate rotational constants of the upper and lower electronic states. Estimate bond lengths in upper and lower electronic states.       |
| CO5 | able to explain the role of Morse parameter and to plot Morse potential curve for a given diatomic molecule  |
| CO6 | Able to explain various parts and their role in recording NMR spectrum using NMR spectrometer  |
| CO7 | Able to record and analyze the NMR spectrum  |

## Course contents:

### Experiments based on Molecular Spectroscopy

1. Record the spectrum of Al arc in air using HR4000 spectrometer. Construct the Deslandre's table by using known wavelengths and calculate the vibrational constants and force constants of upper and lower electronic states
2. Vibrational analysis C<sub>2</sub> Swan system: Record the spectrum of gas flame (C<sub>2</sub> Swan system) in air using high resolution monochromator. Construct the Deslandre's table by using known wavelengths and calculate vibrational constants and force constants of upper and lower electronic states
3. Recording the high resolution spectra of BeO using high resolution spectrometer with CCD camera and calculate vibrational constants and force constants of upper and lower electronic states
4. Rotational analysis of spectra of diatomic molecules (High resolution spectroscopy) for bands with Q-branches
5. Rotational analysis of spectra of diatomic molecules (High resolution spectroscopy) for bands without Q-branches
6. Studies of IR spectra of organic molecules containing various functional groups using IR/FTIR spectrometers.
7. Spectroscopic investigations of molecules using Raman Spectrometer.
8. Record the spectrum of Iodine and determine dissociation energy of I<sub>2</sub> molecule by Brige-Spooner method
9. Calculation of Morse potential energy curves for molecular X and B states of AlO, and to plot wavefunctions and probability amplitudes for first three vibrational levels of the two states
10. Calculation of Morse potential energy curves for molecular states of Swan system of C<sub>2</sub>, and to plot wavefunctions and probability amplitudes for first three vibrational levels of the two states.
11. Calculation of Morse potential energy curves for molecular states of visible system of BeO, and to plot wavefunctions and probability amplitudes for first three vibrational levels of the two states.

**Note: Students should perform any eight experiments.**

### **PHYL-322 – Lab course 6 (C2) : Nuclear Physics: Credits 3**

#### **Learning Objectives:**

- e) Recording the pulse height spectra using latest gamma ray spectroscopy system.
- f) Analysis of recorded pulse height spectra.
- g) Study of various types of gamma ray sources.
- h) Study the NaI(Tl) detector..

#### **Learning Outcomes:**

- e) The student will get a training for using state of the art data acquisition system in Nuclear Physics laboratory
- f) The student will get a training for analysis of recorded pulse height spectra.
- g) The student will be able to perform various kinds of experiments using GM and Scintillation counter.

### **Experiments based on Nuclear Physics**

1. Study of gamma ray spectrum using scintillation counter using single channel analyzer.
2. Absorption of gamma rays in lead.
3. Absorption of gamma rays in aluminum.
4. Alpha spectroscopy with surface barrier detector- energy analysis of an unknown gamma source.
5. Determination of range of beta particles in aluminum.
6. X-ray fluorescence with proportional counter.
7. Determination of range of beta particles from unknown source by feather analysis.
8. Design, fabrication and study of Linear pulse amplifier.
9. Excitation of K-X-rays in different material by beta radiation (verification of Mosley's law).
10. Kinematics of Compton scattering. Compton scattering process.

**Note: Students should perform any eight experiments.**

### **PHYL-322 – Lab course 6 ( D2) : Electrical Properties of solids and Superconductivity:**

**Credits3**

#### **Experiments based on Electrical Properties of solids and Superconductivity**

**Learning objectives:** i) This activity introduces the fundamental principles of four probe resistivity ii) ferroelectricity iii) measurement of dielectric constant of different solid samples

Students will be able to: i) Describe what can be detected by four probe resistivity technique ii) explain the impact of temperature iii) atom size, and impurities on the tests.

**Learning Outcomes:** Acquisition of the following skills: i) Ability to explain basic/fundamental dielectric concepts ii) Ability to extort the relevant information from four probe resistivity papers.iii) Ability to find specific tools for solution of a given ferroelectric, superconducting problem.

#### **Course Contents:**

1. Resistivity Measurement of a given sample by four probe method.
2. Measurement of dielectric constant and its variation with temperature.
3. Determination of bulk density of different materials using immersion technique.
4. Measurement of dielectric constant of liquids.
5. Measurement of electrical conductivity of Graphite at room temperature.

6. Determination of specific heat of Graphite at different temperatures.
7. Measurement of dielectric constant of solids.
8. Porosity determination of Superconducting materials.
9. Determination of Bulk density of ferroelectric materials.
10. To measure ferroelectric hysteresis curves
11. Determination of Curie Temperature of Ferroelectrics.

**Note:** 1) Other experiments may be added as per the availability of instruments.2)

**Students should perform any eight experiments.**

**PHYR-331: (Experimental work): Research Project Part II: Credit 3**

Students are expected to do experimental work as per the formulation of topic of research project selected during 2<sup>nd</sup> semester.

# **Semester - IV**

## Semester – IV

### (Elective Courses)

#### **Generic Electives 4 (A4): Advanced Sensor Technology**

**(Credits: 04 ; Contact Hours : 60 )**

**Lectures: 48; Tutorials: 12**

#### **Learning Objectives:**

1. To facilitate the students to understand
  - a) the concepts of sensor science and technology
  - b) the concept of Sensor materials and different principles of sensing technology which are used at laboratory as well industrial level
2. To provide an opportunity to the students to enter into sensor research and develop smart sensor devices.
3. To create enthusiasm among the students to undertake research in sensors

#### **Learning Outcome:**

1. Students will be able to -
  - a) learn sensor materials and technologies,
  - b) Develop sensor devices and sensor networks.
2. Students will be capable to undertake the job in sensor industries.
3. Students will have option to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline OR do research in sensor science.

#### **Course Contents:**

##### **Unit I : Sensor Materials and Sensor Matrix**

Materials : Material selection criteria, fulfilment of ideal sensor requisite, importance of 1-D materials in sensors, importance of surface area enhancement and enhancement in surface activity, Importance of size dependent Properties for sensing applications; Promising sensing materials: Carbon Nanotubes, Organic Conducting Polymers, Porphyrins and metal nanoparticles, Sensor Fabrication Technologies : AC Dielectrophoretic alignment of SWNTs and surface modification of SWNTs by OCP by charge controlled potentiostatic deposition and porphyrins by solid casting, for SWNTs, confirmation of coating by I-V measurements and electrochemical measurements;

##### **Unit II : Chemical Sensors**

Chemical Sensor Characteristics ; Specific Difficulties ; Classification of Chemical-Sensing Mechanisms ; Direct Sensors : Metal-Oxide Chemical Sensors, Chemiresistive and ChemFET sensors, Electrochemical Sensors, Potentiometric Sensors, Conductometric Sensors, Amperometric Sensors, Complex Sensors: Optical Chemical Sensors Biosensor, Multisensor Arrays, Electronic Noses (Olfactory Sensors),

### **Unit III : Integrated circuit manufacturing techniques for Sensors**

Introduction, **Photolithography:** Masks, Mask alignment, Spinning resist; **Exposure and development:** *Exposure, Development*, Resist tone, Critical dimension (CD) and resolution (*R*) , **Resist stripping:** *Wet stripping, Dry stripping*; **Subtractive techniques:** Overview, **Dry etching:** *Physical etching: sputtering or ion etching, Etching profiles for physical etching, Dry chemical etching, Physical-chemical etching*; **Wet etching:** *Anisotropic and isotropic etching, Etch stop techniques*, Comparison of dry- and wet-etch techniques;

### **Unit IV : Sensors Technology ( Techniques for Sensor Fabrication)**

**Chemical Methods for preparation of sensor matrix:** Chemical bath deposition, SILAR, **Physical vapor deposition :** *Evaporation, Sputtering, Molecular beam epitaxy, Laser ablation deposition*; **Chemical vapor deposition:** *AP CVD and LP CVD, PE CVD, Spray pyrolysis*; **Electrodeposition and electroless deposition:** *Electroless deposition , Electrodeposition, Potentiostatic, Galvanostatic, Cyclic voltammetry* ; **Chemical sensor fabrication technology :** screen printing, spin coating, dip coating, casting

## **PHYE-411 – Generic Electives 4 (B4): Applied Spectroscopy**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

### **Learning Objectives:**

- a) Describe the basic principles of physics as related to the field of photonics.
- b) Integrate the concepts of light, geometric and wave optics and their practical applications in photonics.
- c) Theory and practice of instrumental methods for the separation, identification and quantitative analysis of chemical substances.
- d) To understand how structure and bonding influence the physical properties and reactivity of molecules.
- e) To be able to use crystal field theory to understand the electronic and magnetic properties of transition metal complexes.
- f) To be able to use symmetry to predict molecular orbital diagrams and explain electronic spectra

### **Learning Outcomes:**

- a) After completing this course the student will be able to use spectroscopic methods for qualitative and quantitative analysis.

### **Course Contents**

1. **SPECTROSCOPIC INSTRUMENTATION:** Spectrographs and Monochromators, Speed of Spectrometer, Spectral Transmission Range, Spectral Resolving Power, Free Spectral Range, Prism Spectrometer, Basic Considerations and Spectral Resolving Power of Grating Spectrometers, Multiple Beam Interferometry: Basic Concepts, Comparison between Spectrometer and Interferometer: Spectral Resolving Power, Light Gathering Power, Accurate Wavelength Measurement. [Scope: Laser spectroscopy by W. Demtroder, Springer, chapter 4].
2. **DETECTION OF LIGHT:** Thermal Detectors, Photodiodes, Photoconductive Diodes, Photovoltaic Detectors, Fast Photodiodes, Photodiode Arrays, Photoemissive Detectors, Photocathodes, Photomultipliers, Detection Techniques and Electronic Equipment, photon counting. [Scope: Laser spectroscopy by W. Demtroder, Springer, chapter 4. Spectroscopic Instrumentation].
3. **LUMINESCENCE SPECTROSCOPY:** Introduction, Joblanski Diagram, Phosphorescence, Fluorescence, Resonance Fluorescence and Normal Fluorescence.

Intensity of Transitions. Non Radiative Decay of Fluorescent Molecules, Effects of Medium on Fluorescence Spectra. Population of Triplet States, Phosphorescence Intensity, Solvent Effect, Delayed Fluorescence. Excitation Spectra, Emission spectra, Experimental Methods, Emission Life Time Measurement. Application of Fluorescence and Phosphorescence. [Scope: Spectroscopy Vol. 3 by B. P. Straughan and S.Walkar, London Chapman and Hall, Chapter 5].

- 4. MOLECULAR SYMMETRY AND GROUP THEORY:** The Defining Properties of a Group, Some Examples of Groups, Subgroups, Classes, Symmetry Operations, Symmetry Elements, Algebra of Symmetry Operations, Multiplication Table. Molecular Point Groups, Matrix Representation of Symmetry Operations, Reducible and Irreducible Representations, Character Table for  $C_{2v}$  and  $C_{3v}$  Point Groups, Symmetry Species of Point Groups, Complete Character Table for Point Group, Distribution of Fundamentals among the Symmetry Species, Infrared Activity, Raman Activity.

[Scope: **1)** Molecular Structure and Spectroscopy, by G. Aruldas, Prentice Hall of India pvt, chapter 5.

**2)** Chemical Applications of Group Theory (Third Edition), by F. Albert Cotton, John Wiley & Sons, Chapter 2,3 & 4].

**Tutorials, assignments, seminars based on Units 1 – 4.**

**Books:**

1. Laser Spectroscopy, Volume 1: Basic Principles, Fourth Edition by Wolfgang Demtroder, Springer, ISBN: 978-3-540-73415-4 e-ISBN 978-3-540-73418-5, DOI 10.1007/978-3-540-73418-5 Library of Congress Control Number: 2007939486, © 2008, 2003, 1996, 1981 Springer-Verlag Berlin Heidelberg.
2. Modern Spectroscopy by J. M. Hollas, ISBN: 9780470844167, Published by John Wiley & Sons Ltd. (2004) Fourth Edition.
3. Spectroscopy by B. P. Straughan & S. Walker, ISBN: 0470150319 (v.1, Halsted Press), ISBN: 0470150327 (v.2), ISBN: 0412133806 (v.3, Cased Ed.) London: Chapman & Hall, New York, Vol. 1,2 & 3 (1976)
4. MOLECULAR STRUCTURE AND SPECTROSCOPY, by ARULDHAS, G. , Second Edition ,2004. ISBN: 978-81-203-3215-7, PHI Learning
5. Chemical Applications of Group Theory by F. Albert Cotton, ISBN: 9780471510949, John Wiley & Sons (Wiley - Interscience) (1990) Third Edition.

6. Elements of Group Theory for Physicists by A. W. Joshi, ISBN: 812240975X, New Age International Private Limited publishers, New Delhi, (1997) Revised Fourth Edition.
7. Group Theory and Quantum Mechanics by M. Tinkham, ISBN: 9780486432472, McGraw Hill Book Company, New Delhi (1964).

**PHYE-411 – Generic Electives 4 (C4) : Particle Physics, Nuclear forces and Cosmic rays:**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48 ;Tutorials: 12**

**Learning Objectives:** The themes dealt with in this paper:

11. This course is necessary for the students to make aware to various elementary particles apart from proton, neutron and electron.
12. The knowledge of elementary particles is helpful to classify the nuclear structure, their interactions,
13. The course should be taught as an elective and it should be taught at Semester-IV as it requires understanding of interactions of those particles with other particles (elementary particles) which is a very involved topic and requires knowledge of other aspects of nuclear physics covered in III<sup>rd</sup> semester.
14. The course will help the student for preparation of NET/SET and other competitive examinations.

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- The course is useful to students as it provides knowledge of various elementary particles, their properties etc and the nature of strongest force i.e. Nuclear force.
- The students can get job and opportunity of research in nuclear energy sector and accelerator center.
- The course is extremely important for carrying out theoretical research leading to more and more elementary particles and ultimately vision of universe.
- The origin of universe is a hot topic these days, for which studies in cosmic rays in also necessary.
- In short, the course is the basis for front-line research in physics in present times.

**Course Contents:**

**Unit I: Elementary Particles physics-I**

Concept of elementary particle, Fundamental properties of elementary particles, Classification of elementary particles, Particle Interactions, Coupling constant, Quantum numbers of elementary particles, Conservation laws of elementary particles, Relationship between particle and antiparticle.

## **Unit II: Elementary Particle Physics-II**

Properties of massless and Lepton Particles, Properties of mesons (Pions, Neutral  $\pi$ -meson, K-mesons,  $\eta$ -meson), Properties of Baryons (Nucleons, Hyperons, resonant particle), Description of strange particles (K-mesons and Hyperons, Violation of parity, Strangeness and hypercharge, Properties of strange particles), Quarks and Gluons, Inversions in elementary particles (Time-reversal, Parity, Charge conjugation), Elementary particle symmetries (SU (3)-symmetry, Gell-Mann-Okubo mass formula).

## **Unit III: Nuclear Forces**

Introduction, Characteristics of nuclear forces, The deuteron, The ground state of deuteron, Radius of deuteron, n-n and n-p scattering, p-p scattering below 10MeV, Distinction between p-p and n-p scattering, Similarity between n-n and p-p forces, Meson theory of nuclear forces.

## **Unit IV: Cosmic rays**

Introduction, Types of cosmic rays, Properties of primary cosmic rays, Geomagnetic effect, Interpretation of geomagnetic effect, Properties of secondary cosmic rays, Absorption of cosmic rays, cosmic ray showers, Extensive air showers, origin of cosmic rays.

## **References:**

**PHYE-411 – Generic Electives 4 (D4) : Magnetic Materials and Superfluidity**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

i) The objective of the course is to teach types and origins of magnetism in solids ii) In addition, we will discuss physical reasons that is directly or indirectly related to magnetism. iii) The theories of dia, para, ferro, antiferro and ferri-magnetism will be understood in detail.

**Learning Outcomes:**

**Upon successful completion of the course, students will be able to:**

1. Discover the physical origin of diamagnetism in solids.
2. Discover the physical origin of paramagnetism in solids.
3. Group the materials according to their magnetic susceptibilities
4. Analyze the strong magnetization in ferromagnetic materials
5. Determine the differences between ferro and ferrimagnetic substances
6. Compute the experimental results by theoretical calculations.
7. Argue the magnetic dipole and spin concepts in detail.
8. An ability to apply their broad education toward the understanding of the impact of engineering solutions in a global and societal context.

**Course Contents:**

**Unit I: Diamagnetism and Paramagnetism: (12 Contact Hours)**

Langevin theory of diamagnetism, Langevin theory of Para magnetism, Curie law, quantum theory of paramagnetism, Curie law, magnetism of rare earth ions, iron group ions, crystal field splitting, quenching of orbital angular momentum, Hund's rule, paramagnetic susceptibility of conduction electrons, Problems.

**Unit II: Ferromagnetism: (12 Contact Hours)**

Ferromagnetic ordering, mean field theory, Curie – Weiss law, Heisenberg's exchange interaction, magnon and dispersion relation for magnons, origin of domains, domain walls, coercive force, hysteresis, motion of domain walls, experimental methods to determine the magnetic susceptibility, thickness and energy of Bloch wall, anisotropy energy, Problems.

**Unit III: Antiferro and Ferrimagnetisms: (12 Contact Hours)**

Antiferromagnetic order, the two sublattice model, susceptibility below the Neel temperature, the dispersion relation for magnons in an antiferromagnet, super exchange interaction. Ferrimagnetic order, Curie temperature and susceptibility of ferrimagnets, Spinel, Garnets, ferrimagnetic compounds, Properties: High Temperature Susceptibilities, Specific Heat, structure of ferrites, the saturation magnetization, Neel's theory.

#### **Unit IV: Superfluidity: (12 Contact Hours)**

Phenomenology, two fluid model, Bose-Einstein Condensation, Landau theory, Superfluid velocity and phase of order parameter, super fluid flow, excited state, Quantized vortices in superfluids, Superfluidity at finite temperatures, Time independent Gross-Pitaevskii equation, Ginzberg- Landau equations, second order critical fields, Abrikosov vortex lattices, Berezinskii-Kosterlitz-Thouless (BKT) phase transition and quantized vortex-pairs.

#### **Unit V: Tutorials, assignments and seminar presentation based on Unit I to IV (12 Contact Hours)**

**PHYE-412 – Electives 5 (A5/ B5/ C5/ D5)**

**PHYE-412 – Electives 4 (A5): 8051- Microcontroller**

**(Credits: 04; Contact Hours: 60)**

**Lecturers: 48; Tutorials: 12**

**Learning objectives**

- Give an understanding about the concepts and basics architecture of 8051.
- Provide background knowledge and core expertise in 8 bit microcontroller 8051 microcontroller.
- Impart knowledge about assembly and machine language programming of 8051 microcontroller.
- Help to understand the importance of different peripheral devices & their interfacing to 8051 microcontroller.
- Impart knowledge of different types of external interfaces including LEDS, LCD, Keypad Matrix, Stepper motor & seven segment displays.

**Learning outcomes:**

**CO-1:** Understand the fundamentals of microcontroller systems, assembly language.

Programming, interfaces, and have an ability to apply them.

**CO-2:** Understand and apply the fundamentals of assembly and machine language programming of 8051-microcontrollers

**CO-3:** Design and formulate interfacing experiments for microcontroller

**CO-4:** Solve problems by using the concepts of microcontroller systems.

**CO-5:** Use simulation tools to design and program a microcontroller.

**Course contents:**

**Unit I: 8051 Microcontroller: (12 Contact Hours)**

An Introduction: Microprocessors and microcontrollers, comparing microprocessors and

microcontrollers, a microcontrollers survey, development system for microcontrollers, 8051 microcontroller hardware: block diagram, programming model, pin diagram, the 8051 oscillator and clock, program counter and data pointer, A and B CPU registers, flags and program status word, internal memory, internal RAM, the stack and the stack pointer, special function registers, internal ROM; Input / output pins, ports and circuits: port pin circuits, port 0, port 1, port 2, port 3; external memory, counters and timers, serial data input / outputs, interrupts.

#### **Unit II: Moving data and logical operations: (12 Contact Hours)**

Move operations: Introduction, addressing modes, external data moves, code memory read only data moves, push and pop op-codes, data exchange, simple programs, Logical operations: Introduction, byte level logical operations, bit level logical operation, rotate and swap operations, examples programs.

#### **Unit III: Arithmetic Operations: (12 Contact Hours)**

Introduction, flags, instructions affecting flags, incrementing and decrementing, addition: unsigned and signed, multiple byte signed arithmetic, subtraction: Unsigned and signed subtraction, multiplication and division, decimal arithmetic, examples programs;

#### **Unit IV: Jump and call Instructions and applications: (12 Contact Hours)**

Introduction, jump and call program range, relative range, short absolute range, long absolute range. Jumps, bit jumps, byte jumps, unconditional jumps, Calls and subroutine, subroutines, Calls and the stacks, Calls and returns. Interrupts and returns, examples problems. Application of 8051 microcontroller: Simple programmes using 8051 microcontroller, Display, generation of waves, Pulse measurements, D/A and A/D conversion.

#### **Unit V: Tutorials, assignments and seminar presentation on unit I, II, III, IV; (12 Contact Hours)**

#### **References:**

1. The 8051 Microcontroller, Architecture, Programming and applications by Kenneth J Ayala; Second Edition, ISBN 0-314—20188-2 (hard Copy) 1991; ISBN 0-314-77278-2(Soft) 2014.

Edition ; Tata McGraw-Hill Edition

3. The 8051 Microcontroller and embedded Systems by Muhammad Ali Mazidi and Janice Gillspie Mazidi; Pearson Education.

**PHYE-412 – Electives 5 (B5) : Lasers, Nonlinear Optical mixing and Spectroscopic Phenomena**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

The course provides students with a working knowledge of laser physics and provides introduction into nonlinear optics and laser applications.

The course aims to provide students with an opportunity to develop their knowledge and understanding of the key principles and applications of lasers and non-linear optics, and their relevance to current developments in physics. In particular, it will provide a working knowledge of:

- Laser fundamental principles
- understanding of the critical laser parameters important for their use in various real-world applications
- Optical resonators
- Active and passive resonators
- Spectral characteristics of laser emission
- Homogeneous and inhomogeneous line profiles, spatial hole burning, mode competition
- Tunable lasers
- Non-linear optical mixing
- Sum frequency, difference frequency, second harmonic generation, optical parametric oscillator etc.

**Learning Outcomes:**

Students will be able to:

CO1	explain fundamentals of interaction of radiation with matter; obtain relations between Einstein's coefficients
CO2	explain polarization of light
CO3	describe discrete and continuous absorption and emission spectra
CO4	derive expressions for time derivative of probability amplitudes
CO5	explain coherence properties of radiation field
CO6	explain the role of various elements in a laser
CO7	derive expression for threshold condition for lasing; discuss various sources of losses in laser resonators
CO8	explain spectral characteristic of laser radiation

CO9	differentiate between active and passive resonators, and, homogeneous and inhomogeneous gain profiles
CO10	to explain construction and working of semiconductor laser, dye laser, color center laser; to describe various pumping schemes in semiconductor laser, dye laser, color center laser; to describe various ways of wavelength tuning in semiconductor laser, dye laser, color center laser
CO11	comprehend how wave matching, phase-matching, and index matching are related
CO12	explain the basic physics of nonlinear behavior of optical media; discuss phase matching conditions
CO13	describe sum and difference frequency, second harmonic generation, optical parametric oscillations
CO14	explain fundamentals of x-ray lasers
CO15	explain experimental arrangement for generating sum and difference frequency, second harmonic generation, optical parametric oscillations

### **Course Contents:**

#### **Unit I: Basic Concepts:**

Absorption, induced and spontaneous emission, Polarization of light, absorption and emission spectra, transition probabilities, life times, spontaneous and radiationless transitions, Semiclassical description, Basic equations. Dipole approximation, Coherence properties of radiation fields, temporal, spatial coherence, coherence volume, the coherence function and the degree of coherence

#### **Unit II: Lasers:**

Fundamentals, basic elements, threshold condition, rate equations, laser resonators, open optical resonator, stability of resonators. Spectral characteristics of laser emission, active resonators and laser modes, gain saturation, spatial hole burning. Multimode lasers and gain competition, mode pulling

#### **Unit III: Tunable lasers:**

Basic concepts, semiconductor-diode laser, Tunable solid state lasers, color center lasers, Dye lasers: flash lamp pumped dye lasers, Pulsed-laser pumped dye laser, continuous wave dye laser

#### **Unit IV: Non linear optical mixing:**

Physical Background , Phase Matching, Second harmonic generation, Quasi Phase Matching Sum frequency & higher harmonic generation. X ray laser. Optical parametric oscillator, Difference-Frequency Spectrometer [Scope: Reference 1, chapter 5:5.8]

### **References:**

**PHYE-412 Electives 5 (C5) : Radiation Measurements And Nuclear Dosimetry**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:** The themes dealt with in this paper:

- This course gives awareness and understanding of the applications of nuclear techniques in Industry, Agriculture and Medical safety standards required.
- The course is very advanced course utilizing the concepts learnt in III<sup>rd</sup> Semester in the elective course. "Nuclear reactions and Nuclear energy". So this can also be only an elective course in IV<sup>th</sup> Semester.
- The course will help the student for preparation of NET/SET and other competitive examinations.
- After completion of this course the student will be able to select the possibilities of starting one's own business, using nuclear radiations including agriculture like food preservations, improvement of seed qualities etc.

**Learning Outcomes:** The present unit attempts to achieve the following learning outcomes:

- The student after completing M.Sc. degree with their specialization as nuclear physics will be able to do advanced diploma in using nuclear radiations for medical disorders and diseases on human-beings, animals etc.
- These students after completing their M.Sc. degree, will be having very good opportunities in industry like Polymers, Fault finding in metal, Polymer, equipments and components, high quality welding etc.
- The student will be highly beneficial to the society in his/her later life by performing many essential duties to help people to lead improved and prosperous lives.

**Course Contents:**

**Unit I: Interaction of Nuclear Radiations with matter**

Stopping power of charged nuclear particles, Range and straggling, Stopping power and range of electrons, Absorption of gamma rays, Photoelectric effect, Compton effect, Pair production.

**Unit II: Nuclear radiation measurements**

Crystal conduction counters, Energy resolution of the counter, Surface barrier counters, Cloud

chamber, Diffusion cloud chamber, Bubble chamber, Spark chamber.

### **Unit III: Radiation Protections**

Harms of radiation to body, Radiation safety standards, Radiation dosimetry measuring instruments, Film dosimetry principles, Experimental techniques, Applications, solid state nuclear track dosimetry, Track processing methods, Counting procedure and applications, Safe working methods of nuclear radiation.

### **Unit IV: Applications of Nuclear irradiations**

Introduction, The technique of NMR, Seed oil mass screening by NMR technique, Mossbauer effect, Some experiments using Mossbauer effects, Activation analysis for element detection Solid state nuclear track dosimetry (SSNTD), Radiation effects, Mutation by irradiation.

#### **Books:**

## **PHYE-412 – Electives 5 (D5): Material Synthesis and Characterization**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

#### **Course objectives:**

The course aims at giving the students,

- Fundamentals of material properties using different theories.
- Knowledge of techniques for the synthesis of materials.
- Overall knowledge of materials characterization methods based on microscopy.
- Knowledge of the capabilities and limitations of the different types of analysis methods introduced in the course.

#### **Course Outcomes:**

After completion of the course the student should be able to:

- Describe several synthesis methods for fabrication of materials.
- Use the acquired knowledge to evaluate which synthesis methods can be best suited for fabricating a particular material.
- Explain the data obtained and the phenomena exhibited in the materials analysis.
- Be able to follow the current research and further development within the area of materials characterization.

### **Course contents:**

**Unit I: Beyond Independent Electron Approximation:** The Hartree equations, Thomas- Fermi and Lindhard Theory, the Hartree Fock approximation, the tight binding approximation, the Wigner and Seitz method, energy band calculations Fermi-Liquid theory, Lindhard theory.

**Unit II: Synthesis and Characterization of Ferrites:** Synthesis: successive ionic layer adsorption and reaction (SILAR), solid state reaction route (SSRR), co-precipitation route (CR), properties: Electrical, Mechanical & magnetic, characterization: X-ray diffraction (XRD), Transmission electron microscopy (TEM).

**Unit III: Thin Film Deposition Techniques:** Vacuum pumps: Mechanical pumps-oil sealed Rotary pumps, roots pumps, molecular-drag pumps, cryogenic pumps, vacuum seals, vacuum measurement- thin film nucleation- the capillarity model, the critical Nucleus physical vacuum deposition.

**Unit IV: Synthesis and characterization of HTSC Materials:** Synthesis: solid state reaction route (SSRR), Chemical Routes : Co-precipitation and Sol-Gel. General Properties: mechanical, electrical and magnetic, characterization: X-ray diffraction (XRD), determination of lattice parameters from XRD data, estimation of volume, density; scanning electron microscopy (SEM), scanning tunneling microscopy (STM). Superconducting quantum interference devices system (SQUIDS).

**PHYE-413 – Generic Electives 6 (Any One)**

**PHYE-413 – Generic Electives 6 (A6): Fundamentals of Sensors: Credits 4**

**(Credits: 04; Contact Hours: 60)**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

1. To facilitate the students to understand
  - c) the concepts of sensor
  - d) the concept of different principles of sensors
2. To provide an opportunity to the students to enter into sensor research
3. To create enthusiasm among the students to undertake research in sensors

**Learning Outcome:**

1. Students will be able to -
  - c) learn Sensors, characteristics of sensors, optical fiber and optical sensors.
  - d) develop sensor devices.
2. Students will be capable to undertake research in Sensors.

**Course Contents:**

**Unit I: Introduction**

Sensors and Sensor Science, Sensors–Eyes and Ears of Machines, The Term ‘Sensor’, Optical Sensors, Physical Sensors, Chemical Sensors, elements of chemical sensors, **Sensor Physics**, Solids, Energy Band Model, Lattice Defects, Ionic Conductance, Hopping, Junctions and Potential Barriers, **Primary electronics for sensors** : Amplification by Operational Amplifier, Instruments for electric measurements.

**Unit II : Sensors and Sensor Characteristics**

Sensors, Signals, and Systems; Ideal sensor curve, ideal sensor requisite, Sensor Classifications ; **Sensor Characteristics**: Transfer Function; Span (Full-Scale Input) ; Full-Scale Output ; Accuracy ; Calibration ; Calibration Error ; Hysteresis; Nonlinearity ; Saturation ; Repeatability ; Dead Band ; Resolution ; **Parameters of sensors** : Sensitivity, detection limit, response and recovery time, selectivity, dynamic range, linearity, stability

**Unit III : Optical Sensors**

Introduction of light detectors: Photodiodes, Phototransistor , Photoresistors ; photovoltaic cell, Optical waveguides and fibres, types of optical fibers : single mode, multimode and graded index

optical fiber, concept of TIR and ATR, Optical fibre sensors: Introduction and classification of sensors with optical fibres, Optical fibre sensors with amplitude modulation, Sensor with wavelength modulation; Optical chemical sensors: Introduction, Optical sensors: Methods of detection, Evanescent wave sensors.

#### **Unit IV: Physical Sensors**

Potentiometric Sensors; Gravitational Sensors; LVDT and RVDT , Eddy Current Sensors , Piezoelectric sensors, **Resistive Sensors:** Potentiometers, Strain gages; Inductive sensors, Capacitive sensors, Bridge circuits, Displacement Measurements, **Blood Pressure Measurements:** Extravascular sensors, Intravascular sensors, Disposable pressure sensors

**PHY E – 413-B6: The Physics of Dielectrics: Credits 4**

**(Credits: 04 ; Contact Hours : 60 )**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

- a) Acquiring of knowledge concerning the electrical behaviour of dielectric materials (polar and nonpolar).
- b) Understanding the field changes induced by dielectrics.
- c) Familiarize with the description of real dielectrics by the complex method.
- d) Knowledge about the experimental investigation methods of dielectrics.

**Learning Outcomes:** After completing this course

- a) The student will be able to understand the fundamental concepts of dielectrics.
- b) The student will be able to analyze the complex dielectric spectra.
- c) The student will be able to identify appropriate materials required for various applications.
- d) The student will be able to gain basic knowledge to facilitate the designing of new technical applications.

**Course Contents**

- 1. INTRODUCTION TO THE PHYSICS OF DIELECTRICS:** The types of polarization- electronic polarization, atomic polarization, ionic polarization, orientation polarization, Induced dipole moment, Permanent dipole moment, The static dielectric permittivity, Dielectric relaxation.
- 2. DIELECTRIC THEORIES:** Debye Theory, Onsager's theory. Kirkwood-Frelich's theory, modern theories of the static dielectric permittivity (Böttcher, Nienhuis and Deutch, Ramshaw, Wertheim etc.), The complex dielectric permittivity, Dielectric losses and dispersion.
- 3. FREQUENCY DOMAIN DIELECTRIC SPECTROSCOPY:** Classification of the experimental methods, Bridges, Resonance methods, Coaxial lines, Waveguides, Transient methods, Strip lines, Broad band spectroscopy A frequency response analyzer ( $10^4$  Hz -  $10^6$  Hz), automatic radio frequency bridge (10 Hz -

$10^7$  Hz) coaxial line reflectometer ( $10^6$  Hz-  $10^9$  Hz) and coaxial vector network analyzer ( $10^7$  Hz -  $10^{10}$  Hz).

- 4. TIME DOMAIN DIELECTRIC SPECTROSCOPY:** The single reflection and transition methods, Multiple reflection, transition, lumped capacitance methods, Nonuniform sampling Fourier transform and time domain treatment, Applications

**Books:**

1. Dielectric Properties and Molecular Behaviour, by Nora E. Hill, A. H. Price and Mansel Davies, ISBN 10: [0442034113](#) ISBN 13: [9780442034115](#) Published by Van Nostrand Reinhold Company (1969) London.

**PHYE-413 – Generic Electives 6 (C6):**  
**Nuclear Fission, Fusion and Neutron Physics:**  
**(Credits: 04; Contact Hours: 60)**  
**Lectures: 48 ;Tutorials: 12**

**Learning Objectives:**

This course is necessary for the students to make aware about nuclear fission and fusion reaction. The knowledge of nuclear reaction process is helpful in understanding the nuclear structure, their interactions, the course should be taught as an elective and it should be taught at Semester-IV as it requires understanding of fission and fusion of those particles with other particles (elementary particles) which is a very involved topic and requires knowledge of other aspects of nuclear physics covered in III<sup>rd</sup> semester. The course will help the student for preparation of NET/SET and other competitive examinations.

**Course Contents:**

- 12. Nuclear Fission:** Nuclear fission, Types of nuclear fission, Emission of neutrons in fission, Fissile and Fertile materials, Nuclear fission chain reaction and Four factor formula.
- 13. Nuclear Fusion:** Nuclear fusion, Source of energy in star, Eight synthesizing processes, Condition of controlled fusion and Lawson criteria, Nuclear reactors, Critical size of a reactor, Types of nuclear reactors, Nuclear reactors in India.
- 14. Neutrons:** Discovery of Neutron, Basic properties of Neutron (Mass, Charge, Decay, Half life, Wave properties and Magnetic moment), Energy classifications of Neutrons, Neutron sources, Neutron collimators, Neutron scattering, Measurement of Neutron cross-section.
- 15. Neutron Interaction:** Interaction of Neutrons with nuclei, Interactions of Neutrons with matter in bulk, Energy distribution of thermal neutrons, Neutron detectors (Slow, Intermediate, Fast and Ultra high energy), Neutron spectroscopy (Time of Flight Method), Neutron diffusion, Diffusion of fast neutrons and Fermi age equation, Ultra cold neutrons, Neutrons applications.

6. **Fundamentals of Nuclear Physics**, Jahan sing, Pragati Publication.

**PHYE-413 – Generic Electives 6 (D6): Renewable Energy**

**(Credits: 04; Contact Hours: 60 )**

**Lectures: 48; Tutorials: 12**

**Program Educational Objectives (PEOs)**

<b>PEO-1</b>	Have a strong foundation in Physics with an ability to solve important problems in a modern society as a valuable significant scientist.
<b>PEO-2</b>	Candidate should have a broad based background to practice physics in the area of Electronics, Spectroscopy, Nuclear physics and condensed matter physics.
<b>PEO-3</b>	Have an ability to pursue higher studies and succeed in academic and research careers.
<b>PEO-4</b>	Have the ability to function and communicate effectively, both individually and within multidisciplinary teams using modern tools.
<b>PEO-5</b>	Recognize the need for and process the ability to engage in life-long learning.
<b>PEO-6</b>	Will be sensitive to the consequences of their work, both ethically and professionally, for productive professional careers.

**Program Specific Outcomes (PSOs)**

After 2 years of completion of the program, students will be able to –

<b>PSO-1</b>	Domain knowledge: An ability to apply knowledge of physics and mathematical fundamentals for the solution of complex physical phenomenon taking place in nature and to develop appropriate new technology.
<b>PSO-2</b>	Problem analysis: An ability to identify ,formulate, research literature and analyze complexproblems in solid state devices reaching substantiated conclusions using first principles of Physics, Mathematics.
<b>PSO-3</b>	Conduct investigations of complex problems: An ability to Design and conduct scientific and engineering experiments and to analyze and interpret the resulting data
<b>PSO-4</b>	Modern tool usage: An ability to use the techniques, skills and modern tools necessary for development of solid state devices.

<b>Sr.No</b>	<b>Generic program outcome</b>
<b>5</b>	Citizenship and society: Broad understanding of ethical andprofessional in physical sciences in the context of practices, environmental and society goal other complementary issues, relatives as well as.
<b>6</b>	Environment and sustainability: Broad understanding of the input of physical sciences in a global economic, environmental and societal context.
<b>7</b>	Ethics: Ability to develop practical solutions for problems in physical sciences under professional and ethical constraints.

<b>8</b>	Individual and teamwork: An ability to function effectively within multidisciplinary teams.
<b>9</b>	Communication: A fundamental capability in oral and written communication.
<b>10</b>	Life-long learning: Recognize the need for and have the ability to engage in perpetual learning by working on projects for which they have no prior experience.

**Learning Objectives:** The themes dealt with in this paper:

<b>1</b>	15. To develop the human resource in Renewable Energy (RE) sector which is the need of the hour.
<b>2</b>	16. To create the people who will teach the science of Renewable Energy, this will be also helpful for the promotion of Research in this field.
<b>3</b>	17. To create several self-employment opportunities in renewable energy and energy efficiency Sectors for modestly-trained and self-trained human resources exist in all geographic locations of the country.
<b>4</b>	18. It will help to develop the skills required in renewable energy and energy management fields

**Learning Outcomes (COs):** The present unit attempts to achieve the following learning outcomes:  
**At the end of the course the student should be able to;**

<b>CO-1</b>	An ability to apply knowledge of mathematics, science, and Technologies.
<b>CO-2</b>	An ability to design and conduct experiments, as well as to analyse and Interpret data.
<b>CO-3</b>	An ability to function on multidisciplinary teams.
<b>CO-4</b>	The broad education necessary to understand the impact of technological solutions in a Global, economic, environmental, and societal context.
<b>CO-5</b>	An ability to use the techniques, skills, and modern technological tools necessary for technological practice.

**Objectives of the Course:-**

The objectives of the M.Sc. (Renewable Energy) Course shall be as follows:-

- To develop the human recourse in Renewable Energy (RE) sector which is the need of the hour.
- To create the people who will teach the science of Renewable Energy, this will be also helpful for the promotion of Research in this field.

- To create several self-employment opportunities in renewable energy and energy efficiency Sectors for modestly-trained and self-trained human resources exist in all geographic locations of the country.
- To create several self-employment opportunities in renewable energy and energy efficiency Sectors for modestly-trained and self-trained human resources exist in all geographic locations of the country.
- It will help to develop the skills required in renewable energy and energy management fields.
- To develop proficiencies and skills for becoming successful scientist, technicians in RE sector.
- To develop the expertise for the innovation of different skills and its implementation in RE Sector.
- To explore the different techniques in RE sector.

### **Learning Outcomes:**

- (a) An ability to apply knowledge of mathematics, science, and Technologies.
- (b) An ability to design and conduct experiments, as well as to analyse and interpret data.
- (c) An ability to design a system, component, or process to meet desired needs within realistic Constraints such as economic, environmental, social, political, ethical, health and safety, Manufacturability, and sustainability.
- (d) An ability to function on multidisciplinary teams.
- (e) An ability to identify, formulate, and solve engineering problems.
- (f) An understanding of professional and ethical responsibility.
- (g) An ability to communicate effectively.
- (h) The broad education necessary to understand the impact of technological solutions in a Global, economic, environmental, and societal context.
- (i) An ability to engage in independent learning and recognize the need for continual professional development.
- (j) A knowledge of contemporary issues.
- (k) An ability to use the techniques, skills, and modern technological tools necessary for Technological practice.

### **Course Contents:**

#### **Unit-I: Introduction:**

An introduction to energy sources, present energy consumption and need, world energy futures, energy sources and their availability commercial or conventional energy sources and new energy technologies. Renewable energy sources and prospects. (10P)

#### **Unit-II: Solar Energy:**

Solar Radiation and its measurements, Solar Radiation at the earth surface, Solar Radiation Geometry, Measurements, data, and average solar radiation. Solar energy collectors, transmissive flat-plate collectors, concentrating collectors: focusing type and principle of the conversion of solar radiation into heat. Advantages and disadvantages of concentrating collectors over flat-plate and progress in the field. Solar energy storage, solar energy storage system, solar pond, principle of operation and description of non-convective solar pond, extraction of thermal

energy and application of solar ponds. Application of solar energy, solar water heating, Space heating/cooling (solar heating/cooling of buildings), solar thermal electric conversion, solar electric power generation: solar photo – voltaic, Agriculture and industrial process, solar distillation, pumping, furnace, cooking, green houses and production of hydrogen. (14P)

### **Unit-III: Biomass and Hydrogen energy:**

Introduction, biomass conversion technologies (Wet & Dry processes), Photosynthesis, Biogas generation and factors affecting. Materials used for bio-gas generation, site selection, design, problems and maintaining biogas production. Fuel properties of biogas, utilization of biogas and biomass as a source of energy. Energy plantation, plants proposed and advantages of energy plantation, methods for obtaining energy from biomass. Thermal, chemical and bio gasification of biomass.

General introduction to Hydrogen energy and production, Electrolysis, Thermochemical methods, Fossil fuel methods and solar energy methods. Hydrogen storage, transportation, utilization as an alternative fuel for motor vehicles. Hydrogen technology development in India, its safety and management. (12P)

### **Unit-IV: Wind, Geothermal, Ocean and Chemical Energies:**

Wind Energy: Basic principle of wind energy conversion, Wind data and energy estimation, Types of wind machines, Energy storage, Applications of wind energy. . Geothermal Energy: Estimates of geothermal power, geothermal sources, Prime movers for geothermal energy conversion. Ocean Energy: Types of ocean energy (energy from tides and energy from ocean waves), Applications of ocean energy. Chemical Energy: Fuel cells, Batteries and its applications.(12P)

**PHYE-413 – Generic Electives 6 (E6): Soil Physics**

**(Credits: 04 ; Contact Hours : 60 )**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

- 1) To understand basic Physical processes that occur in soils.
- 2) To understand how soil act as a medium for plant growth.
- 3) To understand how soil physical processes may influence environmental quality to gain some knowledge of the effects of soil physical conditions on plant growth,
- 4) To develop a working knowledge of the methods and instrumentation used in evaluating soil physical properties;

**Learning outcomes:** Students should develop and demonstrate the ability to

1. Understand physical theories used to describe water, mass, and energy flow in the soil-plant- Atmosphere continuum.
2. Apply existing models to analyze key mass and energy transport processes in real-world situations.
3. Develop new modeling tools or approaches to effectively predict soil physical properties or processes relevant to their area of research.
4. Students' knowledge and skill will be developed through assigned readings, homework, exams, lectures, and a semester project.

**Course content:**

**Unit I: Concepts of soil:** general definition of soil, commonplace definition of soil, fundamentals of soil science, the four components of soil,, manufactured soil, soil as a portion of

landscape, boundary limit of a soil, the soil profile, solum, and horizons, soil as an evolutionary body, stage of soil development verses plant growth, The myth of virgin soils, soil fertility and water paradox, soil fertility verses soil productivity, soil and their utilization in society.

**Unit II: Soil as a medium for plant growth:** Factors of plant growth, essential nutrient elements, water needs of plants, oxygen requirements, freedom from inhibitory factors, utilization of the soil by plants, extensiveness of root system, extent of root and soil contact, pattern of soil utilization by plants, ideal soil concept, plant requirement, ideal soil concept as an aid in soil management.

**Unit III: Physical Properties of Soils:** - Soil texture, soil separates, the particle size categories, mechanical analysis by hydrometer method, mechanical analysis by the sand, silt and clay, functions of sand, silt in relation to soil properties, function of the clay, A texture grouping of soils, The texture profile, soil structure, Tillage operation and soil properties, Soil density and weight, Pore space of soil, Soil color and Soil temperature.

**Unit IV: Soil Water Content:** Definitions, direct and indirect measurements, thermo gravimetric, neutron method, methods based on measurement of dielectric constant of soil, capacitance method, alternate approach to field measurements, remote sensing of soil water content.

**References:**

- 1) Fundamentals of soil science (Fourth edition) by C.E. Millar, L.M. Turk, and H.D. Foth.
- 2) Soil analysis – Physical methods by K.A. Smith and C.E. Mullins.
- 3) Soil Physics by Helmut Kohnke.

**PHYE-413 – Generic Electives 6 (F6): Advanced Communication Electronics**

**(Credits: 04; Contact Hours : 60 )**

**Lectures: 48; Tutorials: 12**

**Learning Objectives:**

To facilitate the students to understand:

1. The concepts of communication technology.
2. The concept of different broad band communications which are used at various communications centers.
3. To provide an opportunity to the students to understand evolution of cellular telephone, and call processing.
4. To provide detailed knowledge of satellite communication and its classifications.

**Learning Outcome:**

4. Students will be able to -
  - e) learn sensor materials and technologies,
  - f) Develop sensor devices and sensor networks.
5. Students will be capable to undertake the job in sensor industries.
6. Students will have option to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline OR do research in sensor science.

**Course content:**

1. **Broad-band communications:** Time division multiplexing, Frequency division multiplexing, Microwave links, line of sight links, tropospheric links, satellite communication, Choice of orbit, Multiple Access, FDMA, TDMA, SPADE and Communication package, Propagation of waves, Ground or surface wave, The space wave, Tropospheric waves,, Sky waves and The ionosphere waves, Fresnel zone problem, Fading.
2. **Cellular Telephone Concepts:** Introduction, Mobile telephone service, Evolution of cellular telephone, cellular telephone, Frequency reuse, Interference, Cell splitting, Sectoring, Segmentation, and Dualization, Cellular system topology, Roaming and handoffs, Cellular telephone network components, cellular telephone call processing.
3. **Satellite Communication:** Introduction, Satellite orbits, Satellite elevation categories, Satellite orbital patterns, Geosynchronous satellites, satellite velocity, Round trip time delay of geosynchronous satellite, Clarke orbit, Advantages and disadvantages, Antenna look angles, Angle of elevation, Azimuth angle, Limits of visibility.
4. **Satellite classifications:** Spacing and Frequency allocation, Satellite antenna radiation patterns: Footprints, Spot and zonal beams, Hemispherical beams, Earth beams, Satellite system link models, Uplink model, Transponder, Downlink model Satellite system parameters, Back-of loss, Transit power and bit energy, Equivalent noise temperature.

**OELE-101: Service Course of Department of Physics (Laser in its Application)****From other Departments****(Credits: 04; Contact Hours: 60)****Course Contents:****Unit I: Basic Concepts:**

Absorption, induced and spontaneous emission, Polarization of light, absorption and emission spectra, transition probabilities, life times, spontaneous and radiationless transitions, Semiclassical description, Basic equations. Dipole approximation, Coherence properties of radiation fields, temporal, spatial coherence, coherence volume, the coherence function and the degree of coherence

**Unit II: Lasers:**

Fundamentals, basic elements, threshold condition, rate equations, laser resonators, open optical resonator, stability of resonators. Spectral characteristics of laser emission, active resonators and laser modes, gain saturation, spatial hole burning. Multimode lasers and gain competition, mode pulling

**Unit III: Types of the Laser**

Basic characteristic of laser, Solid Laser, Gas Laser

**Unit IV: Application of Laser**

1. Electronics
- 2.Space Communication
- 3.Medical
- 4.Optoelectronics Devices
5. Agriculture

### **PHYL-421 – Lab course 7 (Based on Electives A4)**

#### **PHYL-421 – Lab course 7(A4):**

#### **A4: Advance sensor technology; Credits 3**

#### **Learning Objectives:**

1. To facilitate the students to understand
  - a) the concepts of sensor science and technology from different principles of sensing viz. Optical fiber based chemical, displacement, pressure sensors, Potentiometric sensor and gas sensors based on conducting polymers and single walled carbon nanotubes.
  - b) properties of optical fiber (viz. Numerical aperture, losses in optical fiber and optical to electrical and electrical – optical characteristics of fiber optic converter)
  - c) the concept of Sensor materials and different principles of sensing technology which are used at laboratory as well industrial level
2. To provide an opportunity to the students to enter into sensor research and develop smart sensor devices.
3. To create enthusiasm among the students to undertake research in sensors.

#### **Learning Outcome:**

1. Students will be able to -
  - a) understand and explain sensor materials and technologies,
  - b) develop sensor devices and sensor networks.
  - c) analyze the system based on sensor and actuators.
  - d) design and develop sensor devices
  - e) Students will be capable to undertake research in Sensors.
  - f) to undertake the job in sensor industries.
  - g) to start his / her teaching career either in science or engineering colleges / institutes as this course is included in science as well engineering discipline OR do research in sensor science.

**Course Contents:**

1. Determination of Numerical Aperture of PMMA optical fiber
2. Losses in Optical fiber.
3. Study of Optical to Electrical (O-E) characteristics of fiber optic Phototransistor converter.
4. Study of Electrical to Optical (E-O) characteristics of fiber optic 660nm and 850nm converter.
5. Optical fiber chemical sensor.
6. Study of Displacement sensor
7. Study of Potentiometric sensor.
8. Gas sensor based on OCP (organic Conducting Polymers)
9. Gas Sensor based on Single Walled carbon nanotubes ( SWNTs)
10. Study of characteristics of photovoltaic cell
11. Study of characteristics of Phototransistor.
12. Study of characteristics of Photoconductive cell
13. Study of characteristics of PIN Photodiode
14. Study of characteristics of IC temperature sensor (LM 335)
15. Study of K (chromel – alumel) type Thermocouple
16. Characteristics of Platinum RTD (Resistance – Temperature Detector)
17. Characteristics of NTC (negative Temperature Coefficient) Thermistor
18. Study of Optical fiber Pressure sensor

**Note: Students should perform at least eight experiments**

**PHYL- 421 – Lab course 7 (based on B4 &B5) ; Credits 3**

**Applied Spectroscopy and Lasers, Nonlinear optical mixing and spectroscopic phenomena:**

**Learning Objectives:**

- a) Basic knowledge of optical phenomena such as interference, interference between parallel plates, polarization, birefringence, absorption in optical media, total internal reflection, etc.
- b) Applications of these phenomena in determining splitting of spectral lines (high resolution spectroscopy)
- c) Behavior of optical media in external electric and magnetic fields
- d) Estimation of parameters of optical media and applications of lasers in investigating these phenomena
- e) Computer interfacing of these experiments and analysis of observations

**Learning Outcomes:**

At the end of the course the student will be able to :

- CO1 get basic training in optics
- CO2 analyse the optical patterns and other observations
- CO3 use spectrophotometric techniques for obtaining unknown concentrations of solutions
- CO4 estimate refractive index of liquids
- CO5 polarize the light and verify Malu's law
- CO6 able to setup magneto optic Faraday effect experiment
- CO7 verify Gaussian propagation of lasers and find laser spot size
- CO8 Understand and explain the basic physics of optical fibers
- CO9 able to arrange various setups for investigation of interference of light and obtain fundamental parameter of media like refractive index

### **Advanced Optics experiments using lasers**

1. Study of polarization of triplet components in transverse configuration using Zeeman effect
2. Study of polarization of doublet components in longitudinal configuration using Zeeman effect
3. Determine the thickness of Fabry-Perot interferometer by exact fraction using CCD camera setup
4. Measure the divergence of a LASER beam
5. To determine the unknown concentration of solute using uv/vis spectrophotometer
6. Measure the refractive index of a liquid (Water) using hollow prism.
7. Measure the attenuation in an optical fiber
8. Verify the Malu's law
9. Setup and study the electro-optic Kerr effect
10. Setup and study the Faraday effect in solids and liquids
11. Measure the grating element of transmission grating
12. Measure the numerical aperture of an optical fiber
13. Measure the Brewster angle and hence the refractive index of a glass
14. To verify Beer and Lamberts law using spectrophotometer

15. Michelson interferometer
16. Fabry-Perot Interferometer
17. Twyman-Green Interferometer

References:

1. MEASUREMENT, INSTRUMENTATION AND EXPERIMENT DESIGN IN PHYSICS AND ENGINEERING by SAYER, MICHAEL, MANSINGH, ABHAI , ISBN: 978-81-203-1269-2 , PHI Learning, 1999.

**Note: Students should perform at least eight experiments**

**PHYL-421 – Lab course 7 (Based on C4)**

**C4: Particle Physics, Nuclear forces, Cosmic rays: Credits 3**

**Learning Objectives:**

1. To facilitate the students to understand;
  - a) The concepts of nuclear physics from different principles viz. Pulse height gamma-ray spectrum of  $^{137}\text{Cs}$ , with MCA, Energy calibration of scintillation spectrometer with SCA and MCA, Least square fitting of a straight line, Inverse Square law, Absorption of Gamma-rays in an absorber, Compton scattering from a lead target, Scattering cross section measurements from plastic targets.
  - b) Properties of nuclear materials (Viz, Backscattering from different targets, Relative efficiency calibration of a scintillation detector, Absolute efficiency calibration of a NaI(Tl) detector, Activity of Gamma-ray source (Area ratio method), Absolute activity of Gamma-ray source by sum peak method,
  - c) Verification of Moseley's Law,, Determination of radioactivity in surface soil, cement and fly ash, Determination of (Half-Life of  $^{137\text{m}}\text{Ba}$ .

**Learning Outcome:**

1. Students will be able to –
  - a) Learn the concepts of nuclear physics from different principles.
  - b) To understand the properties of nuclear materials.
2. Students will be capable to undertake job in BARC and industries
3. Students will have option to start his / her teaching career in science OR do research in gamma ray interaction studies.

**Course Contents:**

1. Pulse height gamma-ray spectrum of  $^{137}\text{Cs}$ .

2. Pulse height gamma-ray spectrum with multichannel analyzer.
3. Energy calibration of scintillation spectrometer with SCA.
4. Energy calibration of scintillation spectrometer with MCA.
5. Least square fitting of a straight line.
6. Inverse Square law.
7. Absorption of Gamma-rays in an absorber.
8. Compton scattering from a lead target.
9. Scattering cross section measurements from plastic targets.
10. Backscattering from different targets.
11. Relative efficiency calibration of a scintillation detector.
12. Absolute efficiency calibration of a NaI(Tl) detector.
13. Activity of Gamma-ray source (Area ratio method).
14. Absolute activity of Gamma-ray source.
15. Absolute activity of a Gamma source by sum peak method.
16. Verification of Moseley's Law.
17. Determination of radioactivity in surface soil, cement and fly ash.
18. Half-Life determination of  $^{137m}\text{Ba}$ .

**Note: Students should perform at least four experiments**

#### **PHYL-421 – Lab course 7 (Based D4)**

#### **Magnetism, Superfluidity and Material Synthesis, Characterization : Credits 3**

#### **D4 : Magnetism, Superfluidity**

1. Thin film deposition by Chemical Bath Deposition (CBD) and measure its thickness.
2. Variation of conductivity with temperature and frequency
3. Thin film deposition by chemical route (Electro deposition)
4. To study the vacuum system (production and measurement)
5. Synthesis of semiconductor nanoparticles by SILAR
6. Determination of size and position of nanoparticles using nano kit
7. Estimation of core loss and coercive force for a ferromagnetic core material of a transformer
8. Paramagnetic susceptibility temperature variation.
9. To determine the magneto resistance of Bismuth crystal / Bismuth compound thin film as a function of magnetic field.
10. Determination of Curie temperature of a ferromagnetic material.
11. Magnetic susceptibility of solids by Guoy's method.
12. Study of magnetic susceptibility in liquids
13. Variation of residual magnetization of carbon steel rod as a function of temperature.

**Note: 1. Students should perform at least Eight experiments**

**PHYL-422 – Lab course 8: (Based on A5)**

**8051- Microcontroller (A5): Credits 3**

**Learning objectives**

- Provide knowledge and expertise in 8- bit microcontroller.
- Impart knowledge about assembly and machine language programming.
- Help to understand the importance of different interfacing to 8051 microcontroller.
- Impart knowledge of different types of external interfaces.
- **Learning outcomes:**
  1. Understand the fundamentals of microcontroller systems, assembly language. Programming, interfaces, and have an ability to apply them.
  2. Understand and apply the fundamentals of assembly and machine language programming of 8051-microcontrollers
  3. Design and formulate interfacing experiments for microcontroller
  4. Solve problems by using the concepts of microcontroller systems.
  5. Use simulation tools to design and program a microcontroller.

**Course contents:** Writing of following Assembly language programs and verify with the help of 8051 microcontroller kit:

1. Programs for addition using 8051 microcontroller.
2. Programs for subtraction using 8051 microcontroller.
3. Programs for multiplication using 8051 microcontroller.
4. Programs for division using 8051 microcontroller.
5. Programs for data transfer.
6. Programs for ones, twos complements.
7. Programs for counters.
8. Program for Ascending and descending numbers using 8051 microcontroller.

9. Program to find Square root of given number using 8051 microcontroller.
10. Program to find Maximum and minimum numbers using 8051 microcontroller.
11. Program for temperature control interface using 8051 Microcontroller.
12. Program for analog to digital converter using 8051 microcontroller.
13. Program to generate ramp, triangular and square waves using DAC through 8255 of 8051 microcontroller.
14. Program for stepper motor interface using 8051 microcontroller.

**Note: Students should perform at least Eight experiments**

### **PHYL-422 – Lab course 8 ((Based on B4 & B6 ); Credits 03** **:Applied Spectroscopy and Physics of dielectrics**

### **Learning Objectives:**

- a) Knowledge about the experimental investigation methods of dielectrics.
- b) Understanding the theoretical knowledge by experiments.
- c) Capacities development for establishing measurement methods.

### **Learning Outcomes:**

- a) After completing this course the student will be able to determine the vibrations for a polyatomic molecule and identify whether they are infrared-active.
- b) On the basis of NMR, FTIR, ESR, PL, TDR, UV-Vis spectra student will able to identify the material.

### **List of Experiment**

1. Study of dielectric relaxation phenomena using TDR.
2. Study of the temperature dependence of permittivity in water using TDR .

3. Study of the temperature dependence of permittivity in alcohol using TDR.
4. Measure the relaxation time of Water using Mansing Service meter.
5. Measure the relaxation time of alcohol using Mansing Service meter.
6. Measure the temperature dependent relaxation time of water using Mansing Service meter
7. Measure the temperature dependent relaxation time of alcohol using Mansing Service meter
8. Study of FTIR spectra of alcohol using FTIR spectrometer
9. Study of FTIR spectra of water using FTIR spectrometer
10. Study of FTIR spectra of nano powder sample using FTIR spectrometer
11. Study of NMR spectra of alcohol using NMR spectrometer
12. Study of NMR spectra of water using NMR spectrometer
13. Study of ESR spectra of water using ESR spectrometer
14. Study of ESR spectra of alcohol using ESR spectrometer
15. Analysis of UV-Vis spectra of water using UV-Vis spectrophotometer.
16. Analysis of UV-Vis spectra of alcohol using prerecorded sample spectrum.
17. Study of UV-Vis spectra of powder samples using UV-Vis spectrophotometer.
18. Study of fluorescence properties of fluorophore using Photo luminance spectrophotometer.
19. Study of phosphorescence properties of fluorophore using Photo luminescence spectrophotometer.

**Note: Students should perform at least eight experiments**

**PHYL-422 – Lab course 8 (Based on C5)**

### **C5: Radiation Measurements, Nuclear Dosimetry: Credits 3**

#### **Learning Objectives:**

1. To facilitate the students to understand
  - a) Plateau of a GM Counter, Dead time of a GM Counter, Statistical Aspects of Radioactivity, Resolution of a NaI(Tl) Detector, the Activity of a Gamma Source.
  - b) The concept of the Absorption Coefficient as a Function of Gamma Ray Energy. Beta Backscattering As a Function of Atomic Number, Beta Energy Determination By Feather's Analysis.
  - c) Study of (Scintillation Counter, Beta Decay, G-M Counter, A Micro Controller Based Machine for Lissajous Figures.
2. To provide an opportunity to the students to enter into nuclear research.
3. To create enthusiasm among the students to undertake research in gamma ray interaction studies.
4. To provide an opportunity to the students to enter into nuclear research.
5. To create enthusiasm among the students to undertake research in gamma ray interaction studies.

#### **Learning Outcome:**

1. Students will be able to –
  - a) Learn the concepts of nuclear physics from different principles.
  - b) To understand the properties of nuclear materials.
2. Students will be capable to undertake job in BARC and industries.
3. Students will have option to start his / her teaching career in science OR do research in gamma ray interaction studies.

#### **Course Contents:**

1. Plateau of a GM Counter.
2. Determination of Dead time of a GM Counter.
3. Statistical Aspects of Radioactivity Measurements.
4. Determination of Resolution of a NaI(Tl) Detector.
5. Determining the Activity of a Gamma Source.
6. The Absorption Coefficient as a Function of Gamma Ray Energy.
7. Beta Backscattering As a Function of Atomic Number.
8. Beta Energy Determination By Feather's Analysis.
9. Study of Scintillation Counter.
10. Study of Beta Decay.
11. Study of G-M Counter.
12. A Microcontroller Based Machine for Lissajous Figures.

**Note: Students should perform at least four experiments**

### **PHYL-422 – Lab course 8 (Based on D5):**

## **Material Synthesis, Characterization and Renewable Energy: Credits 3**

### **LAB COURSE: 8**

#### **Learning Objectives:**

- To provide training of post-graduate level in the field of renewable energy, so that the students after successfully completing the programme may take research work in development of renewable energy systems, which are technologically and economically viable.
- To contribute in the field of energy, renewable energy, energy conservation and energy management which have national, regional and global importance.

#### **Learning Outcomes:**

- h) The student will get a training for using state of the art data acquisition system in Renewable energy.
- i) The student will get a training for analysis of grain size, characteristics of solar cells
- j) The student will be able to design different synthesis routes
- k) The students will be able to fabricate free energy generators using magnets.
- l) Hence the Entrepreneurship.

#### **Course Contents:**

1. Thin film deposition by spin coating.
2. Thin film deposition by Electroforetic Technique.
3. Study the magnetic susceptibility in liquids.
4. Variation of residual magnetization of carbon steel rod as a function of temperature.
5. Estimate the thermal conductivity of given conducting rods.
6. Study the elastic and plastic deformation of metal wires.
7. Study the specific heat capacity of solids
8. Characteristics of solar cell.
9. To find coefficient of thermal expansion of copper/Al/ and brass using their pipes.
10. Thin film deposition by Spray Pyrolysis.
11. Wind energy.
12. Solar cell dark and illuminated characteristics
13. Solar cells in series and parallel-effect of series and shunt resistance.
14. Study the effect of temperature and light intensity on solar cell characteristics
15. Solar PV system (with/without charge controller)
16. Effect of sun tracking on solar PV module efficiency
17. Fabrication of Free Energy Generator Self Running by Magnet With Light Bulb 220V, Measure the Intensity by varying distance
18. Fabrication of Free energy device with light bulbs, salty water, magnets and study the inverse square law using different filters

19. Fabrication of Free energy device with magnets using d.c. motor, study wind energy performance and estimate intensity of light.

**Note:** 1) **Other experiments may be added as per the availability of instruments.**  
2) **Students should perform at least eight experiments**

**PHYR-431: Research Project Part III (Dissertation and Presentation) : Credits 3**

Students are expected to write primary Dissertation and make presentation of the same.
