sustainability. Trees play a vital role in mitigating climate change by absorbing carbon dioxide and releasing oxygen, reducing air pollution, improving air quality, and providing habitats for wildlife. They also contribute to maintaining ecological balance by preventing soil erosion, conserving water, and supporting biodiversity. Trees offer numerous health benefits by providing shade, reducing stress, and improving mental well-being. They also have significant economic value by providing timber, fruits, medicinal products, and other resources, enhancing property values and contributing to tourism and recreation. The tree plantation activity has several positive effects on the environment, including carbon sequestration, air quality improvement, soil conservation, biodiversity support, and temperature regulation. Through day-long activities, local community members were also appraised of these facts and everybody, from within, took pledge to take of the planted saplings and take part if such activities in days to come. In conclusion, the tree plantation activity at Dr. Babasaheb Ambedkar Marathwada University was a commendable initiative aimed at promoting environmental sustainability and community engagement. It highlights the importance and need for tree plantation in mitigating climate change, supporting biodiversity, and improving human health and well-being.
