WOODHEAD
PUBLISHING

12 Bioactive ceramic composite material stability, characterization, and bonding to bone	273
<i>V.H. Ingole, B. Sathe, A.V. Ghule</i>	
12.1 Introduction	274
12.2 Bioactive ceramic composite materials	276
12.3 Bioactivity of bioactive ceramic materials and bone bonding	279
12.4 Conclusions and future trends	286
References	287
Further reading	295
13 Calcium-orthophosphate-based bioactive ceramics	297
<i>S.V. Dorozhkin</i>	
13.1 Introduction	297
13.2 General knowledge and definitions	300
13.3 Bioceramics of CaPO ₄	301
13.4 The major properties	309
13.5 Biomedical applications	320
13.6 Biological properties and in vivo behavior	332
13.7 Nonbiomedical applications of CaPO ₄	343
13.8 CaPO ₄ bioceramics in tissue engineering	344
13.9 Conclusions and outlook	351
References	354
14 Effects of the biological environment on ceramics: Degradation, cell response, and in vivo behavior	407
<i>S. Kargozar, S. Hamzehlou, F. Baino</i>	
14.1 The concept of biocompatibility: A short overview	407
14.2 Assessing the biocompatibility of bioceramics	408
14.3 Biological behavior of almost-inert bioceramics	410
14.4 Biological behavior of bioactive glasses and glass-ceramics	420
14.5 Biological behavior of bioresorbable ceramics	424
14.6 Influence of the ceramic particle size on degradation and biological response	428
14.7 Evolution of mechanical properties in vitro and in vivo	429
14.8 Conclusions	430
References	430
Further reading	437
15 Toxicity of nanomaterials to biomedical applications—A review	439
<i>R. Mala, A.S. Ruby Celsia</i>	
15.1 Introduction	439
15.2 Biomedical applications of nanomaterials	440
15.3 Biodistribution and metabolism of nanomaterials	443
15.4 Toxicity of nanomaterials	444
15.5 Mechanism of toxicity of silver nanomaterials	452

Bioactive ceramic composite material stability, characterization, and bonding to bone

12

V.H. Ingole², B. Sathe², A.V. Ghule^{2,†}

*Dr. Babasaheb Ambedkar Marathwada University, Aurangabad, India, [†]Shivaji University, Kolhapur, India

Chapter Outline

12.1 Introduction	2
12.2 Bioactive ceramic composite materials	4
12.2.1 Calcium-phosphate-based bioactive ceramic composite	5
12.2.2 Bioactive glasses composites	6
12.2.3 Bioactive glass-ceramics	6
12.2.4 Bioactive composites	7
12.3 Bioactivity of bioactive ceramic materials and bone bonding	8
12.3.1 In vitro bioactivity studies	9
12.3.1.1 In vitro assessment with SBF	10
12.3.1.2 In vitro cell studies	11
12.3.1.3 Tools/techniques to determine a bioactive response	12
12.3.2 In vivo bioactivity study	13
12.4 Conclusions and future trends	14
References	15
Further Reading	24

Abstract Musculoskeletal conditions are the most commonly occurring medical conditions, and they have a considerable influence on the quality of health and living standard of the millions of people across the world. Annually, around the globe, approximately 2.3 million bone-tissue graft transplants are performed. The bone fracture, osteoporosis, osteoarthritis, and various neoplastic disorders are the common clinical problems related with bone and skeletal system. The common approaches to these bone problems are autografts or allografts. These protocols have certain limitations such as resorption, donor site morbidity, compromised supply, rejection rate up to 50% at some sites, and the risk of inducing transmissible diseases. Consequently, considerable attention has been directed toward the use of bioactive materials as synthetic grafts for bone regeneration. These include hydroxyapatite (HAP), tricalcium phosphate, bioactive glass, and glass ceramics. More significantly, calcium phosphates are the major constituent of bone mineral. The most extensively used synthetic calcium phosphate ceramic for bone replacement is HAP with a chemical formula of $\text{Ca}_{10}(\text{PO}_4)_6(\text{OH})_2$. It has Ca:P molar ratio of 1.667 and is regarded as the most stable composition compared to other calcium phosphate ceramic within a pH range of 4.2–8.0. Calcium phosphate ce-
